Does Foxconn have a facility that demonstrates environmentally safe control of air and water discharge?
As a beekeeper and honey producer near the Foxconn site, can I be assured that my honey will not be contaminated from either air or water pollution? Bees tend to pick up what is in the environment via static charge while flying.

Who will monitor air and water quality at and around the Foxconn facility?

Flat screen glass facilities use deionized or U.P. water to clean glass plates. UPW is not allowed to be discharged into the environment without treatment. How will UPW be treated or will it merely be diluted?

Will the wetlands that are being destroyed at the Foxconn site be banked or mitigated within the vicinity?

How will the heavy metals waste be kept out of the air and water discharged at the Foxconn facility?

How will the Foxconn facility impact the Pike River project?
