Subject:	water for Foxconn
Date:	Friday, February 09, 2018 9:39:58 AM

Dear DNR,

People can live without many things, but not without water. We have a responsibility to our grandchildren and future generations to make certain they will have clean, life-sustaining water available.

If Racine were asking to use seven million gallons per day that could then be recycled back to Lake Michigan, that would seem reasonable. But reporting says that 39% of the water will be "lost". That is 2,730,000 gallons of water every day. Lost. What does that mean? The DNR has a responsibility to answer that question.

Will millions of gallons of water become too toxic to be restored to the Great Lakes basin? The manufacture of LCD screens is known to be a very toxic process. Is the Racine wastewater treatment adequate to remove heavy metals from the water used by Foxconn?

Please do not approve the application from Racine for Foxconn to take millions of gallons daily from the Great Lakes. Chose to protect life in our Great Lakes area.

Sincerely,
Rebecca Alwin
