There appears to be insufficient information in the application on five issues: First, what are the likely contaminants in the water discharge from the FoxConn plant to the water treatment system (there is no listing in the permit)? Second, is the Racine Water Treatment system adequate to remove these contaminants from waste water before discharging them back to the lake? Third, how would the Racine Water Treatment system deal with water from FoxConn that does not meet their input standards for water treatment? Fourth, what penalties or other contractural requirements are in place for FoxConn to meet the input standards of the Racine Water Treatment system? Five, the standards for FoxConn water discharge need to be spelled out in the permit. Unless and until these questions can be answered, I would move for a denial of the permit.
