Subject:	On the Foxconn water diversion issue
Date:	Saturday, March 10, 2018 4:47:46 PM

I am sure you will hear a lot of firm objections based on DNR past behavior and the ongoing needs in Wisconsin and the Great Lakes basin for water conservation, which grows in importance every year.

But let's focus on the simply reality that the Racine water plant is assuring the public it can handle Foxconn water without evidence. The evidence is unclear in two factors at least: 1. Foxconn has still not explained its system for getting Lake Michigan water and returning it. What sounds simple in description involves a ton of manufacturing and drainage issues, among others. Any blueprints?

2. The Racine water managers think they can handle the chemicals and other waste volume being thrown at them though there is evidence from Taiwan and China that the chemicals used in such manufacture have unknown qualities in terms of treatment, etc. Confidence is no substitute for knowledge.

One hearing will not answer all the questions. A body of scientific analysis and discussion needs to be examined ahead of time by the public and the DNR.
