## 2024 Wadable Trout Streams Summary Report Pierce, St. Croix and Western Dunn Counties

Page 1

### Introduction And Objectives

The Baldwin Wisconsin Department of Natural Resources (DNR) fisheries management staff conducted electrofishing surveys on wadable trout streams across Pierce, St. Croix and western Dunn counties. The primary objectives for these surveys were to characterize relative abundance, recruitment and size structure for all trout and overall ecological integrity through an index of biological integrity (IBI) based on all fish species captured in the sampled survey sites. The following report is a summary of trout metrics for all streams and stations surveyed in 2024. This data is used to monitor the overall health and status of trout populations. Please refer to the Guide to Wisconsin Trout Fishing Regulations for applicable size and bag limit restrictions for the stream you fish.

### DNR Contact

Kasey Yallaly-Senior Fisheries Biologist  
890 Spruce Street  
Baldwin, WI 54002

### Regulations

Category: Green and Red  
Daily Bag and Size Limit:

Please refer to the regulations booklet for the specific stream.

### Survey Methods

- Trend survey stations are sampled annually
- Watershed rotation stations are sampled on a 10 year rotation
- Pre-and post-habitat improvement stations are sampled for a target of 5 years pre- and post-construction
- All stations are sampled using backpack or stream barge electrofishing units
- The distance surveyed for each station is 35 times the mean stream width at that location or a minimum of 330 feet (100 meters) if the stream is less than 3 meters wide
- Sampling generally occurs upstream of bridges or road crossings
- All trout are counted and measured and all other species are counted in order to calculate an Index of Biotic Integrity (IBI) score.
- Metrics used to describe trout populations include average length, catch per unit effort (CPUE) and length frequency distribution.

### Metric Descriptions

- **Catch per unit effort (CPUE)** is a method of quantifying fish population relative abundance. For all trout surveys, we typically quantify CPUE as the number of a given size class of trout captured per mile of stream. CPUE indexes are compared to other trout streams throughout Wisconsin by what percentile (PCTL) they fall out in. For example, if a CPUE is in the 90th percentile, it is higher than 90% of the other CPUEs in the state. CPUE percentiles can also be used to categorize trout abundance as low density (<33rd percentile), moderate density (33rd - 66th percentile), high density (66th - 90th percentile) and very high density (>90th percentile).
- **Length frequency distribution** is a graphical representation of the number or percentage of fish captured by half inch or one inch size intervals.
- **Index of Biotic Integrity (IBI)** is a rating of environmental quality based on the fish assemblage. Scores of 90 - 100 indicate excellent stream quality, while scores less than 30 indicate poor stream quality. Our analysis utilizes the IBI for Wisconsin coldwater streams. Coldwater streams in Wisconsin are those in which the maximum daily mean water temperature is usually <22°C (71.6°F). A coolwater stream IBI may also be used when a stream doesn't fit the temperature criteria for a coldwater stream.
