C264H – Stand 14 (43 acres): This is a 49-year old stand of aspen, with white spruce scattered in pockets around the stand. This stand will undergo a coppice with standards harvest to maintain aspen as the primary cover type.

C265H – Stand 11 (8 acres): This is a well stocked stand of poletimber white spruce that is 55 years old. There are mature aspen growing around the periphery of the stand. This stand appears to have never been thinned before. The objective of this sale is to thin the spruce to improve crown spacing and improve the growth of the remaining crop trees.

C265H – Stand 12 (95 acres): This stand is comprised of aspen with an origin year of 1961. It is well stocked and in the small sawtimber size class. White spruce is scattered in clumps in portions of the stand. A coppice with standards harvest will be conducted to maintain early successional aspen as the primary cover type. Some of the spruce are exhibiting decline and will be marked for removal.

Biomass harvesting is permissible.
