Stand 4 (7 acres) is an oak stand of 1919 origin. The last harvest was in 2011, timber sale 919H. The proposed harvest will be an overstory removal. Restrictions will need to be enforced on the north unit of #4 due to an NHI element occurrence.

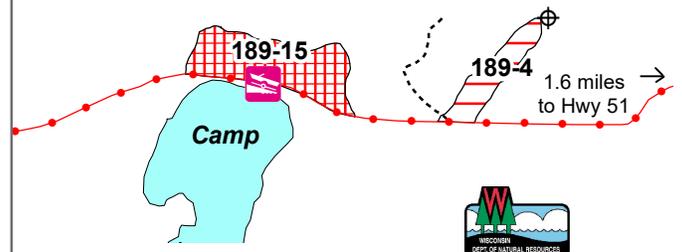

Stand 12 (13 acres) is an oak stand of 1918 origin. A shelterwood harvest occurred in 2011. In 2014, an oak regen survey measured 2,327 oak seedlings per acre. The overstory will now be harvested to release the oak seedlings.

Stand 15 (8 acres) is a white pine stand on the north side of Camp Lake. The early successional tree species will be harvested and the pine thinned.

Stand 16 (29 acres) is a white pine stand with abundant balsam fir and other pine species. This stand will receive a regeneration harvest.

Stand 17 (9 acres) is an oak stand. It was last harvested in 2011 with timber sale 919H. The regeneration is a mix of species. This stand is scheduled for an overstory removal.
