These four red oak sawlog stands are very similar to one another. They originated in 1920 and have a BA of 38 square feet. Each had a shelterwood harvest conducted in the past five years; and each will undergo an overstory removal harvest. Five to seven large oak will be retained per acre for green tree retention. Prior to the harvest an attempt may be made to conduct a prescribed fire in a portion of the proposed sale. The objective will be to set back the aspen and maple and release the red oak seedlings.

A seasonal restriction will be put in place to prevent the spread of oak wilt. BMP's along Jute Lake will be put in place to protect water quality.
