These three red oak sawlog stands are very similar to one another. They originated in 1919 to 1923 and have a BA of 32 square feet. Each had a shelterwood harvest conducted in the past three years; and each will undergo an overstory removal harvest. Five to seven large oak per acre will be retained for green tree retention. Prior to the harvest an attempt may be made to conduct a prescribed fire in a portion of the proposed sale. The objective will be to set back the aspen and maple and release the red oak seedlings.

A seasonal harvest restriction will be imposed to limit the spread of oak wilt.
