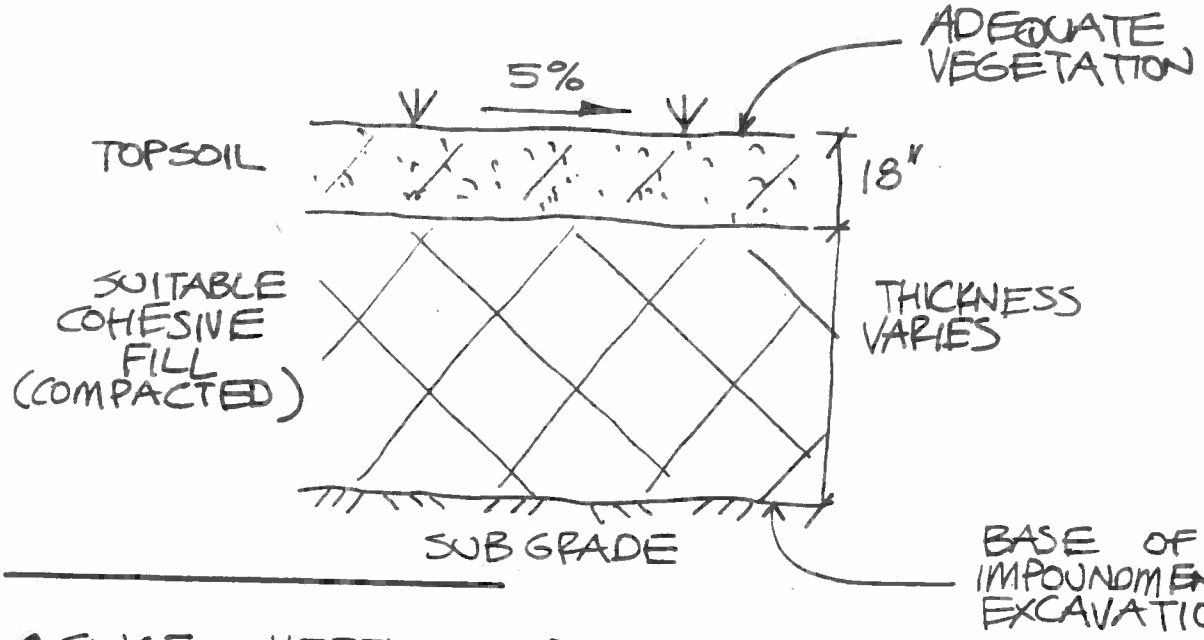
DESCRIPTION DESIGN CALCULATIONS
— IMPOUNDMENT CLOSURE

FINAL COVER DESIGN CALCULATIONS

I. CLEAN CLOSURE



- SINCE VERTICAL PERCOLATION THROUGH THE TOPSOIL / FILL WOULD NOT PRODUCE ANY SIGNIFICANT AMOUNTS OF UNDESIRABLE MATERIALS, NO MIGRATION ANALYSES ARE PERFORMED.
- THE COVER IS DESIGNED TO PROMOTE DRAINAGE AND MANAGE FLOWS. REFER TO SOIL LOSS COMPUTATIONS AND SETTLEMENT ESTIMATES FOR ADDITIONAL SUPPORTING DESIGN ANALYSES.
- COMPACTION, GOOD SURFACE DRAINAGE, AND VEGETATION ARE ANTICIPATED TO REDUCE IMPACTS FROM FREEZE/THAW CYCLES. REFER TO SURFACEWATER PLAN.

Title of run = WATERSHED VII HYDROGRAPH

Watershed data

Hydraulic length = .03 miles
Elevation change = 7 feet.
Area = .25 acres
Concentration time = 2.093058E-02 hours
Curve number = 90

Storm data

SCS Type 2 storm, 24 hour storm
Total precipitation = 4.4 inches
Storm duration = 24 hours
Unit hydrograph type = Disturbed
Max. Discharge = .2871107 cfs
Discharge volume = .2750078 acre ft

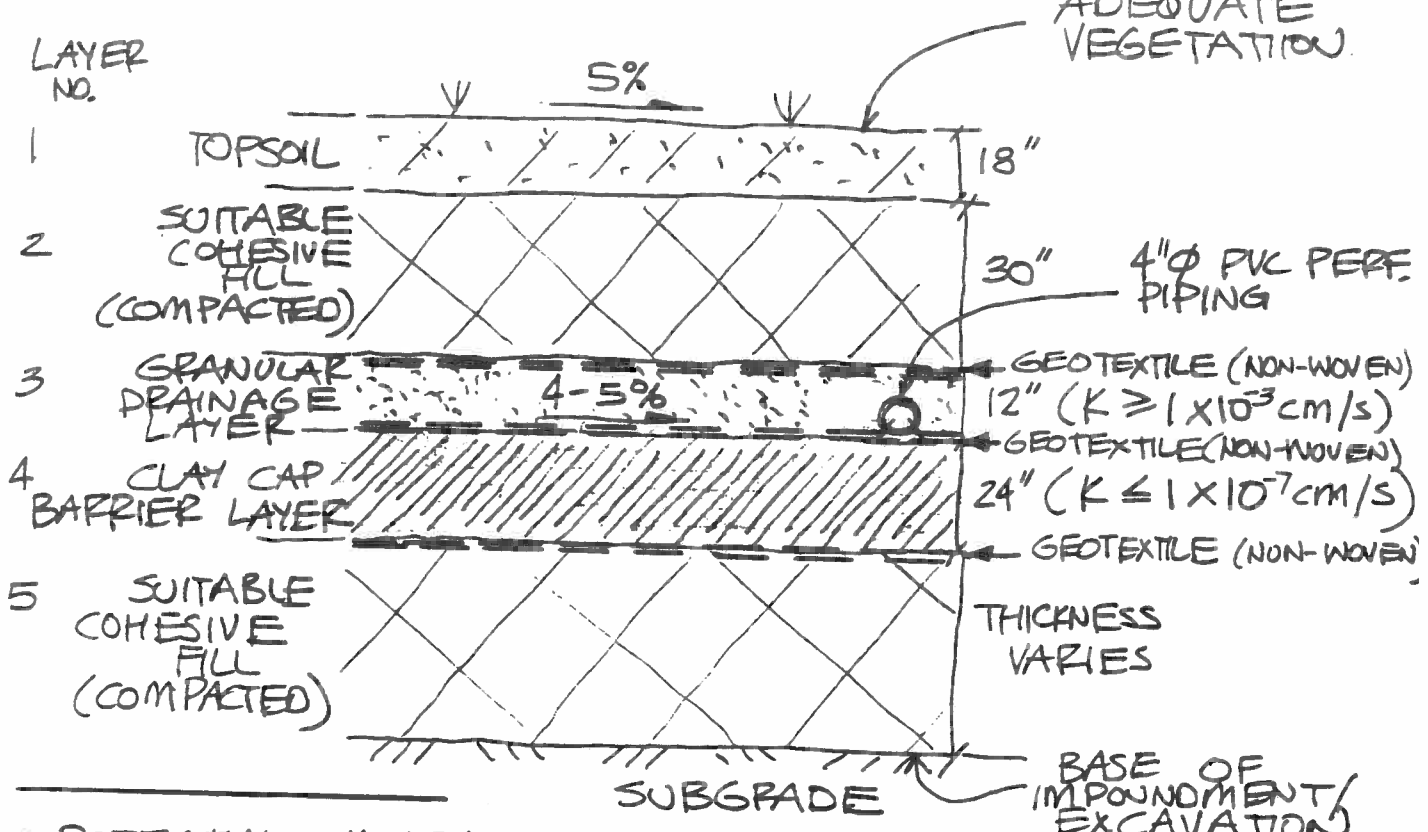
DESCRIPTION DESIGN CALCULATIONS - IMPOUNDMENT CLOSURE

II CONTINGENCY PLAN



- POTENTIAL MIGRATION OF PRECIPITATION THROUGH THE LANDFILL IS EVALUATED THROUGH USE OF THE HYDROLOGIC EVALUATION OF LANDFILL PERFORMANCE MODEL (H.E.L.P.). THE MODEL IS ALSO USED TO DEFINE DESIGN CRITERIA FOR THE DRAINAGE LAYER TO MINIMIZE ANY HEAD BUILD-UP ON THE CLAY CAP AND THUS EFFECTIVELY REDUCE THE POTENTIAL FOR PERCOLATION THROUGH THE BARRIER LAYER.
- REFER TO SOIL LOSS AND SETTLEMENT COMPUTATIONS FOR ADDITIONAL DESIGN ANALYSES. REFER TO THE SURFACEWATER MANAGEMENT PLAN FOR SUPPORTING COMPUTATIONS.

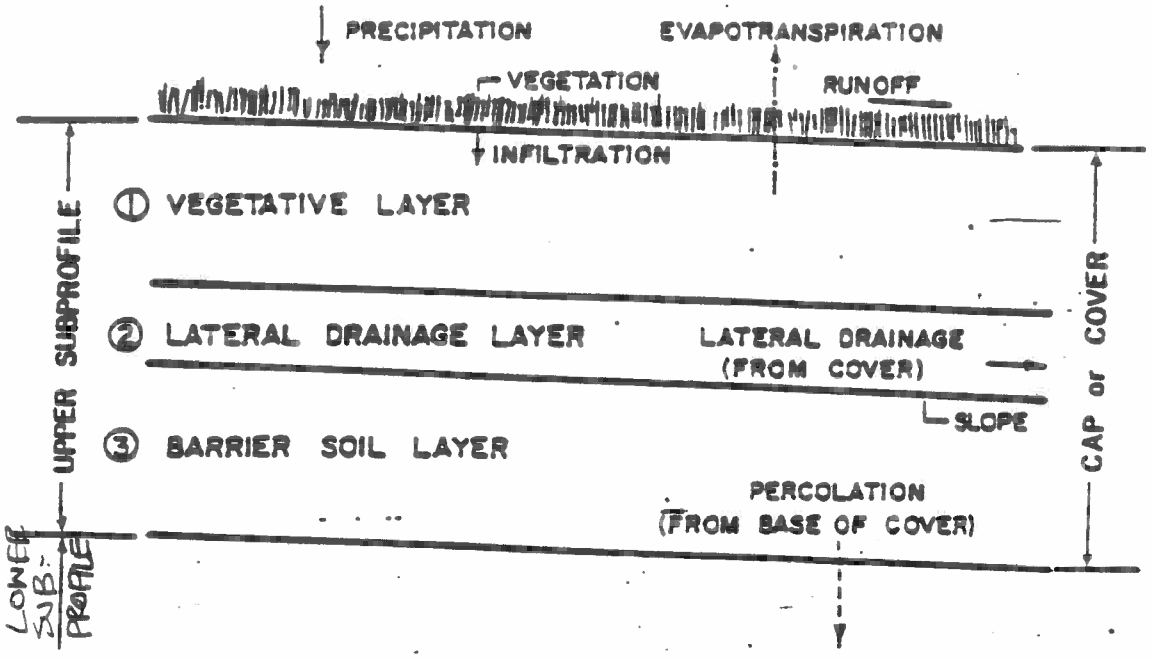
PROJECT NAME: KOPPERS - SUPERIOR, WIS. SITE

PROJECT NO. 87-38-68 SHEET 3 OF 20

DESCRIPTION DESIGN CALCULATIONS - IMPOUNDMENT CLOSURE

H.E.L.P. MODEL INPUT / ASSUMPTIONS

1) DEFINITIONS:



2) SOIL PROPERTIES ARE ASSUMED BASED ON SITE SOIL INFORMATION (CLASSIFICATION TESTING AND VISUAL CLASSIFICATIONS). IN THE CASE OF THE DRAINAGE LAYER, PROPERTIES ARE DEVELOPED TO MINIMIZE MIGRATION.

3) CLIMATOLOGICAL DATA FOR ST. CLOUD, MINNESOTA IS ASSUMED DUE TO THE RELATIVELY CLOSE PROXIMITY TO THE SITE (ABOUT 100 MILES). IT IS ASSUMED THAT THIS DATA (1974 THROUGH 1978) IS REPRESENTATIVE FOR THE PURPOSE OF ESTIMATING RAINFALL PERCOLATION AND DRAINAGE LAYER EFFICIENCY.

ALMES & ASSOCIATES INC.
CONSULTING ENGINEERS

BY: JMG DATE: 5/27/87 CHKD BY: TE DATE: 5/27/87
PROJECT NAME: KOPPERS - SUPERIOR, WIS. SITE
PROJECT NO. 87-38-68 SHEET 4 OF 20
DESCRIPTION DESIGN CALCULATIONS - IMPOUNDMENT CLOSURE

EVALUATION OF FINAL COVER COMPONENTS / SYSTEM:

IN REFERENCE TO THE HELP MODEL OUTPUT (ATTACHED):

LAYER 1 – TOPSOIL

REFER TO SURFACEWATER MANAGEMENT PLAN FOR RELATED DESIGN CALCULATIONS.

LAYER 2 – FILL (COMPACTED)

NO PERTINENT DESIGN CALCULATIONS

LAYER 3 – GRANULAR DRAINAGE LAYER / PIPING

A. TOTAL AMOUNT OF INFILTRATION TO DRAIN (DRAINAGE FROM TOP BARRIER)

- AVG. MONTHLY TOTAL (PEAK IN MAY):

$$= 0.168\ IN \times \frac{Ft}{12\ IN} \times 70{,}000\ Ft^2$$

$$= 980\ Ft^3 / 30\ DAYS\ (33\ Ft^3/D)$$

- PEAK DAILY DRAINAGE

$$= \underline{103.2\ Ft^3/DAY}\ (0.001\ cfs)$$ GOVERNS DESIGN

B. CAPACITY OF 4" ϕ PVC PIPE:

USING MANNINGS EQN. ($n = 0.009$ – REF #1)

$S = 0.005\ Ft/Ft$ (ASSUME FULL FLOW)

$$Q = \frac{1.49}{n} AR^{2/3} S^{1/2}$$

$$= \frac{1.49}{0.009} (0.087)\left((0.087)/(1.05)\right)^{2/3} (0.005)^{1/2}$$

$$= 0.19\ cfs = 16{,}724\ CF/DAY\ (125{,}000\ G/D)$$

$16{,}724 >>> 103 \rightarrow$ THEREFORE PIPE IS ADEQUATE.

ALMES & ASSOCIATES INC.
CONSULTING ENGINEERS

BY: JMG DATE: 5/27/87 CHKD BY: T.F. DATE: 5/27/87
PROJECT NAME: KOPPERS - SUPERIOR, WIS. SITE
PROJECT NO. 87-38-68 SHEET 5 OF 20
DESCRIPTION DESIGN CALCULATIONS - IMPOUNMENT CLOSURE

C. CHECK PERFORATIONS CAPACITY:

SAY 1/4" ϕ SPACED 3" APART (4 / FOOT)

AREA = 0.00034 Ft^2 / HOLE

TOTAL LENGTH OF PIPE = 1050 L.F.

ESTIMATE 8,400 HOLES FOR THE TOTAL LENGTH OF PIPE; BOTH SIDES OF PIPE.

ASSUME ORIFICE FLOW THROUGH THE HOLE PERFORATIONS:

$$Q = C A \sqrt{2gh}$$

Q = FLOW (cfs)
C = FRICTION COEFF. (USE 0.632)
A = AREA OF FLOW
g = 32.2 Ft/s^2
h = HEAD - USE AN AVG. HEAD OF 0.5 IN. (0.04 Ft)

$$Q = (0.632)(0.00034\ Ft^2)((2)(32.2)(0.04\ Ft))^{1/2}$$

= (0.00034 cfs = 30 CF/D / HOLE x 8400 HOLES
= 250,000 CF / DAY

WHICH IS >> 103 CF/D SO HOLES ARE ADEQUATE FOR PIPE.

D. CHECK CAPACITY OF DRAINAGE LAYER:

ASSUME LAYER IS USCS CLASS'N. OF GP (SAND-GRAVEL MIX). FROM REF. # 8 APPLYING DARCY'S EQN:

$$Q = K_p A S$$

ALMES & ASSOCIATES INC.
CONSULTING ENGINEERS

BY: JM6 DATE: 5/27/87 CHKD BY: T.E. DATE: 5/27/87
PROJECT NAME: KOPPERS - SUPERIOR, WIS. SITE
PROJECT NO. 87-38-68 SHEET 6 OF 20
DESCRIPTION DESIGN CALCULATIONS - IMPOUNDMENT CLOSURE

WHERE K_p = PERMEABILITY (MEINZER UNITS OF GAL/DAY-FT^2)
$\leq$ 10,000 FOR SAND/GRAVEL MIXES

S = SLOPE OF HYD. GRADIENT
SAY 2 IN. HEAD (PEAK VALUE) OVER 125 FEET OR 0.0013 Ft/Ft

A = FLOW AREA FOR A 100 Ft-WIDE SECTION OF SLOPE (12" THICK)
= 1 x 100 Ft = 100 Ft^2

$$Q = 10{,}000 \frac{GAL}{DAY\text{-}Ft^2} \times 100\ Ft^2 \times 0.0013$$

= 1300 GAL/DAY FOR 100' OF SLOPE BUT WITH 4 SIDES OF PIPE FLOWING (1100± LF) Q_T = 14,300 GAL/DAY = 1911 CF/DAY

1911 CF/D >> 103 CF/DAY THEREFORE GRAVEL/SAND LAYER IS ADEQUATE TO DRAIN MIGRATING PERCOLATION IN LESS THAN ONE DAY. DRAINAGE LAYER IS ADEQUATE.

LAYER 4 - CLAY CAP.

IN ACCORDANCE WITH THE PERTINENT REGULATIONS THE CLAY CAP WILL BE (FINAL) 24 INCHES THICK AND AT LEAST 1×10^{-7} CM/S IN-PLACE PERMEABILITY (SATURATED).

ALMES & ASSOCIATES INC.
CONSULTING ENGINEERS

BY: JMG DATE: 5/27/87 CHKD BY: T.E DATE: 5/27/87
PROJECT NAME: KOPPERS - SUPERIOR, WIS. SITE
PROJECT NO. 87-38-68 SHEET 7 OF 20
DESCRIPTION DESIGN CALCULATIONS
IMPOUNDMENT CLOSURE

PERCOLATION FROM BASE OF COVER: (CONTINGENCY)

AS PRESENTED BY THE HELP MODEL OUTPUT, THE PERCOLATION IS ESTIMATED AT ABOUT AN AVERAGE OF 3200 CU. FT. OF PERCOLATION PER YEAR. THIS REPPRESENTS ONLY 2 % OF THE PRECIPITATION AND IS JUDGED TO BE INSIGNIFICANT RELATIVE TO THE SURROUNDING ENVIRONMENTAL CONDITIONS; THE 24-INCH THICK CLAY CAP IS ADEQUATE.

HEAD ON CLAY: (CONTINGENCY)

AS PRESENTED BY THE HELP MODEL OUTPUT THE HEAD OF MIGRATED PRECIPITATION ON THE CLAY CAP (UNDER PEAD DAILY RAINFALL CONDITIONS) IS ONLY 1.7 INCHES WHICH IS SIGNIFICANTLY LESS THAN THE CRITERIA FOR "BOTOM" LINERS (12 INCHES) AND THEREFORE THE DRAINAGE SYSTEM (GRANULAR ZONE / PIPING) IS ADEQUATE.

ALMES & ASSOCIATES INC.
CONSULTING ENGINEERS

BY: JMG DATE: 5/27/87 CHKD BY: T.F. DATE: 5/27/87
PROJECT NAME: KOPPERS - SUPERIOR, WIS. SITE
PROJECT NO. 87-38-68 SHEET 8 OF 20
DESCRIPTION DESIGN CALCULATIONS
IMPOUNDMENT CLOSURE

GEOTEXTILES (IN CASE OF CONTINGENT CLOSURE)

USE ONE OF THE FOLLOWING NON-WOVEN FILTER FABRICS AS A SEPERATING MEDIA:

- BETWEEN THE FILL AND TOP OF THE DRAINAGE LAYER;
- BETWEEN THE DRAINAGE LAYER AND TOP OF CLAY; AND,
- BETWEEN THE CLAY AND UNDERLYING FILL.

- MIRIFI 180N (8 OZ/YD^2)
- SUPAC 8NP (8 OZ./YD^2)
- BIDIM U34 (8OZ./YD^2)
- AEF 880 (8 OZ./YD^2)

OR AN APPROVED EQUAL. INSTALL AS PER MANUFACTURER.

REFER TO DESIGN DWGS. FOR DETAILS.

DESCRIPTION SURFACEWATER MANAGEMENT PLAN - IMPOUNDMENT CLOSURE

INTRODUCTION

THE RUNOFF CONTROL AND MANAGEMENT SYSTEM HAS BEEN DESIGNED TO MANAGE STORMWATER RUNOFF (SURFACEWATER) TO MINIMIZE EROSION AND SEDIMENTATION. THE RUNOFF MANAGEMENT COMPUTATIONS FOLLOW AND ARE BASED ON THE FOLLOWING GENERAL CRITERIA/ ASSUMPTIONS:

1) SOIL CONSERVATION SERVICE (SCS) METHODS ARE APPLICABLE TO THE SITE. A TYPE II STORM DISTRIBUTION IS ASSUMED FOR THE RAINFALL ANTICIPATED DURING THE 25-YEAR FREQUENCY/ 24-HOUR DURATION STORM. UPLAND CURVE METHODOLOGY IS ASSUMED IN CONSTRUCTING SYNTHETIC (UNIT AND WATERSHED) HYDROGRAPHS.
2) MANNINGS EQUATION IS USED IN COMPUTING OPEN-CHANNEL FLOW CHARACTERISTICS.
3) EXISTING CHANNELS, DIVERSIONS, AND CULVERTS ARE EVALUATED AND UPGRADED AS DICTATED BY THE CALCULATIONS. ONLY WATERSHEDS CONTRIBUTING SIGNIFICANT RUNOFF IN THE IMMEDIATE VICINITY OF THE IMPOUNDMENTS (WITHIN

DESCRIPTION SURFACEWATER MANAGEMENT PLAN - IMPOUNDMENT CLOSURE

THE KOPPERS PROPERTY) ARE INCORPORATED INTO THIS MANAGEMENT PLAN.

4) IT IS ASSUMED THAT DUE TO THE RELATIVELY SMALL WATERSHED AREA TOTAL (17.8 ACRES) AND "UNDISTURBED" PERCENTAGE OF AREA; THAT NO ADDITIONAL SEDIMENTATION BASIN(S) WILL BE REQUIRED. EXISTING WATERSHEDS ARE ASSUMED TO BE STABILIZED, HOWEVER, HYDROGRAPHS WERE DEVELOPED BASED ON SCS "DISTURBED" WATERSHED TYPE AS CONSERVATIVE.

CHANNEL / WATERSHED SUMMARY

CHANNEL NO.	REACH	CONTRIBUTING WATERSHEDS	TOTAL CONTRIBUTING ACREAGE
C-1	—	VIII	3.7
C-2	—	IX	3.6
C-3	A	X	2.3
	B	X; XI	3.9
	C	I, II, III, IV, VIII, IX, X, XI	14.6
	D	I, II, III, IV, V, VIII, IX, X, XI	16.1
C-4	—	I, II, VIII, IX,	8.5
C-5	—	VI	1.4
C-6	—	I THROUGH XI	17.82
D-1	—	I, II	1.21
D-2	—	II, III	0.90

SINCE THE TIME STEP USED IN DEVELOPING THE HYDROGRAPHS IS RELATIVELY HIGH (0.5 HOURS) THE LAG TIME REQUIRED FOR FLOW FROM HYDROGRAPH GENERATION POINT TO POINT OF INTEREST IS ASSUMED TO BE NEGLIGIBLE. HYDROGRAPHS FOR EACH CHANNEL ARE DEVELOPED BY DIRECTLY SUPERIMPOSING EACH WATERSHED HYDROGRAPH WITH NO LAG TIME (ALL BEGINNING AT TIME = 0.0 HRS.). THIS PROCEDURE IS CONSIDERED TO BE CONSERVATIVE SINCE THE PEAK DISCHARGES ARE LIKELY TO OCCUR AT DIFFERENT TIMES FOLLOWING THE START OF THE RAINFALL.

PROJECT NO. 87-38-68 SHEET 5 OF 33
DESCRIPTION SURFACEWATER MANAGEMENT PLANS - IMPOUNDMENT CLOSURE

BASED ON THE CHANNEL/WATERSHED SUMMARY, THE FOLLOWING IS A SUMMARY OF DESIGN FLOWS FOR THE SITE CHANNELS/DIVERSIONS:

CHANNEL/ DIVERSION	PEAK DISCHARGE (Q_P) (1)	DESIGN DISCHARGE (cfs)
C-1	5.1	6
C-2	5.0	5
C-3A	4.3	5
C-3B	7.6	8
C-3C	22.5	23
C-3D	25.3	26
C-4	11.6	12
C-5	3.1	4
C-6	28.8	29
D-1	1.5	2
D-2	1.0	1

ASSUME ALL CHANNEL/DIVERSION SIDE SLOPES ARE 2H:1V

(1) SUMMATION OF INDIVIDUAL PEAK FLOWS FOR WATERSHEDS CONTRIBUTING TO THESE CHANNELS/DIVERSIONS.

ALL CHANNELS/DIVERSIONS HAVE 2H:1 SIDE SLOPES WHICH ARE VEGETATED. ALL CHANNELS/DIVERSIONS ARE TRIANGULAR IN CROSS-SECTION (BOTTOM WIDTH = 0 Ft).

(1) BOTTOM SLOPE APPROXIMATED BY SLOPE EXISTING IN FIELD (AS PER JUNE, 1984 SITE TOPO).

(2) TOTAL DEPTH (D_t) = FLOW DEPTH (D_f) + FREEBOARD (D_{fb}) WHERE $D_{fb} = \sqrt{CY}$

$Y = D_f$ AND $C = 1.5$ (AS PER REF NO. 1)

(3) SINCE ALL CHANNEL/DIVERSION VELOCITIES ARE ≤ 4 fps GRASS LINING EROSION PROTECTION IS ADEQUATE.

DESCRIPTION DESIGN CALCULATIONS - IMPOUNDMENT CLOSURE

SETTLEMENT

ESTIMATE THE SETTLEMENTS RESULTING FROM BACKFILLING THE EXCAVATED SURFACE IMPOUNDMENTS. THE PURPOSE OF THIS IS TO ACCOMODATE ANY SETTLEMENT / SUBSIDING INTO THE DESIGNED FINAL COVER TO MAINTAIN ITS INTEGRITY. THIS WILL ESSENTIALLY REALIZE 1) A DECREASED POTENTIAL FOR LEAKAGE (THROUGH THE COVER) DUE TO POSSIBLE CRACKING AND 2) INCREASED RUNOFF POTENTIAL BY MAINTAINING AN ADEQUATE UNIFORM SLOPE.

ANALYSIS ASSUMPTIONS: THE FOLLOWING ASSUMPTIONS ARE MADE REGARDING SETTLEMENT:

1. BASED ON PREVIOUS SUBSURFACE EXPLORATION AT THE SITE(1) THE ATTACHED SITE PLAN AND TYPICAL SECTION ARE ASSUMED REPRESENTATIVE OF SITE CONDITIONS.
2. SITE CONDITIONS ARE ASSUMED TO CONSIST OF THE FOLLOWING GENERAL SOILS, AND (BASED ON THE LIMITED TEST DATA AND OUR EXPERIENCE WITH SIMILAR SOILS, THE

PROJECT NO. 87-38-68 SHEET 3 OF 8
DESCRIPTION DESIGN CALCULATIONS - IMPOUNDMENT CLOSURE

SUPERIOR SITE SOILS) ARE JUDGED TO POTENTIALLY CONTRIBUTE THE FOLLOWING TYPES OF DEFORMATION/COMPRESSION (REFER TO TYPICAL SECTION):

ELEV. 645± TO ELEV. 665± : STIFF TO VERY STIFF CLAY

ELEV. 615± TO ELEV. 645± : INTERLAYERED SAND, GRAVEL, AND CLAY (MED DENSE TO VERY STIFF)

BOTH MAJOR SITE STRATA COULD POTENTIALLY CONTRIBUTE PRIMARY AND SECONDARY CONSOLIDATION AS WELL AS ELASTIC SETTLEMENT COMPONENTS. THESE ARE ASSESSED BELOW.

3) ASSUMING A NATURAL GROUND SURFACE OF APPROXIMATELY ELEV. 670±; OVEREXCAVATION OF SOIL AND COMPACTED BACKFILL OPERATIONS WILL NOT APPRECIABLY ADD ADDITIONAL LOAD TO THE UNDERLYING CLAYS THAT HAVE NOT ALREADY BEEN IMPOSED BY THE ORIGINAL OVERBURDEN. FURTHER, SITE SOILS ARE VERY LIKELY TO BE HIGHLY OVERCONSOLIDATED DUE TO GLACIAL MOVEMENTS IN THE REGION. THIS IS EXEMPLIFIED BY THE RELATIVELY STIFF/DENSE CONSISTENCIES SHOWN IN THE BORINGS OF PREVIOUSLY REFERENCED REPORT. ASSUME SITE CLAYS ARE OVERCONSOLIDATED. FURTHER ASSUME THAT THE SOILS MOST LIKELY TO CONSOLIDATE WOULD BE THOSE IMMEDIATELY UNDERLYING THE IMPOUNDMENTS (i.e. EL 645 – EL 665).

ALMES & ASSOCIATES INC.

BY: JMG DATE: 5/25/87 CHKD BY: T.E. DATE: 5/27/87 (57)
PROJECT NAME: KOPPERS - SUPERIOR, WIS. SITE
PROJECT NO. 87-38-68 SHEET 4 OF 8
DESCRIPTION DESIGN CALCULATIONS - IMPOUNDMENT CLOSURE

4) ASSUME THAT SUITABLE COHESIVE FILLS WITHIN THE OVEREXCAVATED / EXCAVATED IMPOUNDMENTS WILL BE PLACED AND COMPACTED (CONTROLLED FILL) ACCORDING TO GOOD ENGINEERING PRACTICES TO MINIMIZE SETTLEMENTS, INCREASE DENSITY, PROVIDE EROSION RESISTANCE, AND INCREASE SHEAR STRENGTH. THE FILL / COVER SYSTEM IS NOT ANTICIPATED TO CONTRIBUTE ANY SIGNIFICANT COMPRESSIBILITY SINCE IT IS A CONTROLLED FILL MATERIAL. HOWEVER, AS WITH ALL FILLS, VARIABILITY MAY BE ACCOUNTED FOR BY CONSERVATIVELY ASSUMING THAT THE COMPACTED FILL COULD POTENTIALLY SETTLE 1% (TOTAL OF THE FILL THICKNESS. THIS WILL BE SUPERIMPOSED ON CONSOLIDATION AND ELASTIC SETTLEMENTS.

5.) ASSUME THE EXISTING DIKES WILL EITHER REMAIN IN-PLACE OR BE REPLACED WITH CONTROLLED FILL. IN ANY CASE, THE INCREASED LOAD WILL BE INSIGNIFICANT COMPARED TO THE IMPOUNDMENT FILL AND THESE WILL NOT CONTRIBUTE TO ANY SETTLEMENTS.

6) ASSUME TIME RATE OF SETTLEMENT TO BE INSIGNIFICANT FOR THIS APPLICATION

7) MAXIMUM SETTLEMENTS ARE ESTIMATED FOR THE THICKEST FILL (HIGHEST LOAD) AREAS. SETTLEMENTS (POTENTIAL) AT THE OUTER LIMITS OF THE FILL WILL BE ZERO; VARYING LINEARLY BETWEEN THESE POINTS.

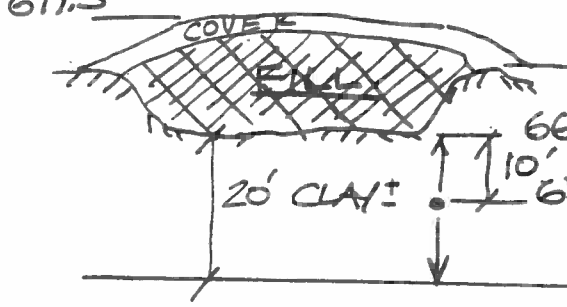
ASSUMING AN EXISTING GROUND SURFACE OF EL 667 (APPROX. BASE OF IMPOUNDMENT)



σ'_{V_0} = 115 PCF x 10 Ft
= 1,150 PSF

ASSUME NO OVERBURDEN LOAD DUE TO IMPOUNDMENT MATERIAL OR LIQUID.

- CHANGE IN STRESS: ($\Delta\sigma'_{V_0}$)

MAXIMUM HEIGHT OF FILL = (679.5 - 667) = 12.5 Ft
(ASSUME NO DISSIPATION OF VERTICAL STRESS WITH DEP

$\Delta\sigma'_{V_0}$ = 120 PCF x 12.5 Ft = 1,500 PSF

TOTAL SETTLEMENT (S_T) = $S_i + S_c + S_s$
(S_i: ELASTIC; S_c: PRIMARY CONSOLIDATION; S_s: SECONDARY COMPRESSION (CREEP))

$$S_i = qB\frac{1-\nu^2}{E_s} I_w$$

(REFERENCE NO. 2; pg 157)

ASSUME B = 200 Ft*; q = 0.75 TSF; I_w = 1.2

* B IS THE LEAST DIMENSION OF THE 350' x 200' LOADED AREA.

$$S_i = (1.5\ KSF)(1.2)\frac{(1-0.3^2)}{450\ KSF}(200\ Ft)$$

$$= \underline{0.73\ Ft\ (9\ INCHES)}$$

ASSUMING OVERCONSOLIDATION:

$$S_c = C_{CR}\frac{H_o}{1+e_o}\ LOG\ \frac{\bar{\sigma}_{vo}+\Delta\bar{\sigma}_v}{\bar{\sigma}_{vo}}$$

$$= (0.064)\frac{(20\ Ft)}{1.6}\ LOG\left(\frac{1150+1500}{1150}\right)$$

$$= (0.064)\ (12.5)\ (0.36)$$

$$= \underline{0.29\ Ft\ (3.5\ INCHES)}$$

SECONDARY COMPRESSION IS ASSUMED TO BE NEGLIGIBLE COMPARED WITH THE MAGNITUDE OF SETTLEMENTS ESTIMATED AS A RESULT OF ELASTIC AND PRIMARY COMPRESSION.

ESTIMATE OF CONTROLLED FILL SETTLEMENT:

TOTAL FILL THICKNESS ≅ 12.5 Ft
ASSUME 1% COMPRESSION (TYPICAL)

$$12.5\ Ft \times 0.01 = \underline{1.5\ INCHES}\ (MAXIMUM)$$

$$S_t = S_i + S_c + S_s + 1.5\ INCHES$$

$$= 9 + 3.5 + 0 + 1.5 = \underline{14\ INCHES}\ (1.2\ Ft.)$$

NOTE THAT THIS IS A CONSERVATIVE VALUE OF THE MAXIMUM POTENTIAL SETTLEMENT AS A RESULT OF THE (ASSUMED) CONSERVATIVE SOIL PARAMETERS. BASED ON AVAILABLE LAB DATA, THE HIGH PLASTICITY OF THE SITE CLAYS*

ALMES & ASSOCIATES INC.
CONSULTING ENGINEERS

BY: JMG DATE: 5/25/87 CHKD BY: TF. DATE: 5/27/87
PROJECT NAME: KOPPERS - SUPERIOR, WIS. SITE
PROJECT NO. 87-38-68 SHEET 8 OF 8
DESCRIPTION DESIGN CALCULATIONS - IMPOUNDMENT CLOSURE

ARE LIKELY TO PRECLUDE THE DEVELOPMENT OF POTENTIAL SETTLEMENT CRACKING,

SHOULD THE CLOSED SITE REQUIRE A CLAY CAP CLOSURE. A 14-INCH SETTLEMENT (MAXIMUM) WOULD ONLY REDUCE THE COVER SLOPE FROM 5% (DESIGN) TO ABOUT 4% ASSUMING ONLY SETTLEMENT AT THE CENTER. IN ACTUALITY, SETTLEMENT COULD BE EXPECTED TO OCCUR OVER THE FULL SLOPE AS A FUNCTION OF FILL THICKNESS. IT IS THEREFORE REASONABLE THAT THE SETTLED SLOPES WOULD BE ON THE ORDER OF 5%.

ALTHOUGH THERE IS A GENERAL LACK OF AVAILABLE SITE SOIL LABORATORY DATA, IT IS OUR JUDGEMENT THAT THE OVERCONSOLIDATED SITE CLAYS MAY EXPERIENCE LESS THAN HALF OF THE MAXIMUM POTENTIAL SETTLEMENT CALCULATED ABOVE. CONSEQUENTLY, FINAL SLOPES WILL HAVE GRADES OF AT LEAST 3% AND THE INTEGRITY OF A CONTINGENT CLOSURE (INCLUDING A CLAY COVER) WILL BE MAINTAINED. THIS IS FURTHER SUPPORTED BY THE FACT THAT THE MAJORITY OF THE SETTLEMENT IS (THEORY-BASED) ELASTIC COMPRESSION, A PORTION OF WHICH WILL OCCUR IMMEDIATELY UPON LOADING; PRIOR TO CLAY PLACEMENT IN THE CASE OF THE CONTINGENCY PLAN.

* PL = 41, PI ≈ 40% AS PER GAI LAB DATA.

PROJECT NAME: KOPPERS - SUPERIOR, WIS. SITE
PROJECT NO. 87-38-68 SHEET 1 OF 1
DESCRIPTION DESIGN CALCULATIONS - IMPOUNDMENT CLOSURE

SLOPE STABILITY CONSIDERATIONS

SINCE THE CLOSED IMPOUNDMENTS WILL BE CONSTRUCTED WITH 5% SLOPES, (2.9°) IT IS HIGHLY UNLIKELY THAT UNSTABLE SLOPE CONDITIONS WILL DEVELOP WITHIN THE COMPACTED FILL. BY INSPECTION, THE SLOPES ARE VERY STABLE AND WILL AID IN MAINTAINING THE CLOSURE COVER INTEGRITY.

ADDITIONALLY, AS A RESULT OF THE EXCAVATED IMPOUNDMENTS (BOTTOM EL. 667±) A TYPICAL BEARING CAPACITY FAILURE IS VERY UNLIKELY DUE TO THE EMBEDMENT OF THE FILL IN THE STIFF SITE SOILS.

THE SLOPES ARE ADEQUATELY STABLE AS DESIGNED.

DESCRIPTION DESIGN CALCULATIONS - IMPOUNDMENT CLOSURE

FREEZE/THAW CONSIDERATIONS

BASED ON INFORMATION OBTAINED FROM THE CITY OF SUPERIOR, WISCONSIN, ENGINEERING DEPARTMENT AND BUILDING INSPECTION DEPARTMENT, THE ENGINEERING DESIGN FROST DEPTH FOR FOUNDATIONS IN THE CITY OF SUPERIOR IS 5. FEET. THEREFORE, THE FINAL COVER FOR THE IMPOUNDMENT CLOSURE IS DESIGNED TO BE A MINIMUM OF 5 FEET THICK TO "INSULATE" THE 24-INCH THICK CLAY CAP IN THE CASE OF A CONTINGENT CLOSURE. IN THIS CASE, THE DRAINAGE PIPING (INVERT) IS SIMILARLY COVERED BY 5 FEET AND IS THUS PROTECTED FROM SIGNIFICANT FREEZING.

THE OUTSLOPE DISCHARGE POINT OF THE PIPING IS, OBVIOUSLY, LESS THAN 5' BELOW GROUND HOWEVER, SHOULD THE SYSTEM FLOW DURING THE ANTICIPATED "WET SEASON", THE POSSIBILITY OF PIPE CLOGGING (BY ICE) IS SIGNIFICANTLY REDUCED DUE TO ABOVE-FREEZING TEMPERATURES DURING THE SPRING/SUMMER/FALL.

CROP MANAGEMENT AND RUNOFF CONTROL FACTORS

ASSUMING CLOSURE BEGINS IN JANUARY:

A.) JAN 1 TO FEB 1
EXCAVATION / TESTING / BACKFILLING

B.) FEB 1 TO MARCH 1
COMPACTED SLOPES W/ MULCH

C.) MAR 1 TO MAY 1
SEED (PERMANENT) 1ST 60-DAY

D.) MAY 1 TO DEC 31
PERMANENT VEGETATION (2-12 MONTHS)

Table 5.4 Typical C_3 Factor Values Reported in the Literature.*

Condition	C_3 factor
1. Bare soil conditions	
freshly disked to 6-8 inches	1.00
after one rain	0.89
loose to 12 inches smooth	0.90
loose to 12 inches rough	0.80
compacted bulldozer scraped up and down	1.30
same except root raked	1.20
compacted bulldozer scraped across slope	1.20
same except root raked across	0.90
rough irregular tracked all directions	0.90
seed and fertilize, fresh, unprepared seedbed	0.64
same after six months	0.54
seed, fertilize and 12 months chemical	0.38
not tilled signs crusted	0.01
tilled signs crusted	0.02
compacted fill	1.24-1.71
undisturbed except scraped	0.66-1.30
scarified only	0.76-1.31
sawdust 2 inches deep; disked in	0.61
2. Asphalt emulsion	
1250 gallons/acre	0.02
1210 gallons/acre	0.01-0.019
605 gallons/acre	0.14-0.57
302 gallons/acre	0.28-0.60
151 gallons/acre	0.65-0.70
3. Dust binder	
605 gallons/acre	1.05
1210 gallons/acre	0.29-0.78
4. Other chemicals	
1000 lb fiber glass roving with 60-150 gallons/acre	0.01-0.05
Aquatain	0.68
Aerospray 70, 10 percent cover	0.94
Curasol AE	0.30-0.48
Petroset SB	0.40-0.66
PVA	0.71-0.90
Terra-Tack	0.66
wood fiber slurry, 1000 lb/acre fresh	0.05
wood fiber slurry, 1400 lb/acre fresh	0.01-0.02
wood fiber slurry, 3500 lb/acre fresh	0.10
5. Seedings[1]	
temporary, 0 to 60 days[2]	0.40
temporary, after 60 days	0.05
permanent, 0 to 60 days[2]	0.40
permanent, 2 to 12 months	0.05
permanent, after 12 months	0.01
6. Brush	0.35
7. Excelsior blanket with plastic net	0.04-0.10

1. If plantings are used with mulches, use the minimum C_3 values.
2. If dry weather occurs at planting and emergence is a problem, extend the 0-60 days to a period when rainfall normally occurs.

CONTACTS

Koppers Company, Inc., Superior, Wisconsin Plant

Mr. David Shaw - Plant Manager

Mr. Warren Dolsen - Assistant Plant Manager

Keystone Environmental Resources, Inc.

R. J. Anderson - Environmental Program Manager

R. M. Morosky - Project Manager

II. Introduction

It is Koppers contention that the sprayfield at its Superior, Wisconsin facility is not a RCRA hazardous waste unit. Although Koppers hereby reserves all of its rights to challenge the classification of the sprayfield as a hazardous waste unit, this plan is submitted pursuant to Chapter 181 of the Wisconsin Administration Code and comments received from the Wisconsin Department of Natural Resources (WDNR).

Subject to its legal rights as recorded above, Koppers intends to follow the guidelines as established in the aforementioned regulations when closing the sprayfield. These guidelines and the task associated with the closure of the sprayfield are described in the following sections of this document.

III. General Description

The spray irrigation field was constructed in the mid 1970's. Water from the second surface impoundment of the two stage series is discharged to the sprayfield. A map (attachment 1.0) locates the spray irrigation field relative to the surface impoundments and the plant facilities.

IV. Partial and Final Closure Activities

Koppers will begin closure of the sprayfield after November 8, 1988. Closure activities will proceed in conjunction with closure of the surface impoundments.

The sprayfield closure process includes the biodegradation of any wastewater constituents and the monitoring of soils and soil pore liquids to determine when closure activities are complete. In the event that this process is not feasible, additional closure activities will be implemented. The following sections detail the tasks for closure.

V. Closure Performance Standard

The closure plan for the spray irrigation field was designed such that the facility should not require further maintenance or control. However, a contingent plan is also presented in this document in the event clean closure using the described methodology is not feasible.

The plan ensures the treatment of wastewater constituents to sufficient levels so as to eliminate threats to human health and the environment. This includes the migration or potential escape of contaminants to the groundwater, surface waters or to the atmosphere. Contaminated materials generated during closure and equipment decontamination will be disposed of in an approved hazardous waste facility.

VI. Contents of Closure Plan

The designated project supervisor for the surface impoundment closure will also oversee the closure of the spray irrigation field. Personnel requirements will include a drilling contractor and sampling laboratory personnel. Plant personnel will perform all other site work necessary to effect a clean closure as described below.

1.0 Reconnaissance Survey

Closure of the sprayfield will be initiated once flow from the surface impoundments is terminated as described in the Closure Plan for the Surface Impoundments. At that time, the soils within the sprayfield will be evaluated to determine the existence and extent of any wastewater constituents. Initially, samples will be taken from ten locations within the sprayfield and analyzed for napthalene, phenols and oil and grease. This will provide a basis for closure operations. The sample points are located on a grid system as seen in attachment 2.0 but may be slightly modified to include areas affected by the spray.

The evaluation will begin with a comprehensive field reconnaissance survey to quantify the constituent levels in the sprayfield soils and to locate a suitable area outside of the sprayfield for background sampling. Background samples for impoundment closure may be used if acceptable to the WDNR. After the sprayfield has been inspected visually, the grid system may be modified to locate soil core sample points in more appropriate areas.

1.1 Soil Sampling (To confirm clean closure)

One or more background soil samples will be taken from an area unaffected by plant operation but representative of sprayfield soils. This sample will be statistically compared to a minimum of 10 soil core samples taken within the sprayfield area. Attachment 2.0 locates the 10 soil sample locations. The exact sample locations may vary slightly to ensure that the area of influence of the spray

nozzles is included. The samples will be analyzed individually in order to develop a contaminate gradient diagram for the area. If "hot spots" exist they may be excavated and disposed of in an approved RCRA disposal site. A statistical analysis approach to sampling and data evaluation similar to those described in TEST METHODS FOR EVALUATION OF SOLID WASTE, PHYSICAL/CHEMICAL METHODS, SW-846 (U.S. EPA 1982b) will be used when developing the program. Samples will be taken uniformly across the grid shown in Attachment 2.0.

1.2 Water Samples

In addition to soil core samples, soil pore liquid samples may be taken if the moisture level is sufficient. Groundwater monitoring currently being conducted at the site will continue.

1.3 Sample Analysis

All samples, both soil and water, will be analyzed for constituents found to be present in the plant wastewater and additional parameters as listed with their respective EPA test method in Table 1.0. The chemical analyses on all of the samples will be performed by an approved laboratory. Typical QA/QC procedures can be found in Appendix A of this document.

If the evaluation indicates that there is an appreciable difference between background soils and sprayfield soil or if the initial screening indicates significant contamination closure will proceed in the manner described below. An appreciable difference is defined as two standard deviations from the background sample(s).

2.0 Closure Procedure

Adjustments to nutrients and pH will be made such that biodegradation is maximized. The soil will then be tilled and seeded with a non-food chain vegetative cover and the wastewater delivery system will be modified to deliver

"clean" water to provide necessary soil moisture. The soil moisture will be maintained at a level to support the growth of the vegetative cover and to enhance the biodegradation of constituents. The existing berm will also be maintained to prevent run-off and run-on.

TABLE 1

ANALYTICAL PARAMETERS FOR SOIL SAMPLES
KOPPERS COMPANY, INC.
SUPERIOR, WI PLANT

Parameter	Test Method	Parameter	Test Method
pH	9045	arsenic	7060
conductivity	9050	barium	6010
Total Organic Carbon (TOC)	Walky-Black	cadmium	6010
phenol	8040	chromium	6010
pentachlorophenol	8040	lead	7421
2-chlorophenol	8040	magnesium	6010
p-chloro-m-cresol	8040	selenium	7740
2,4-dimethylphenol	8040	zinc	6010
2,4-dinitrophenol	8040	copper	6010
trichlorophenols	8040		
tetrachlorophenols	8040		
chrysene	8310		
naphthalene	8310		
fluoroanthene	8310		
benzo(b)fluoranthene	8310		
benzo(a)anthracene	8310		
dibenzo(a)anthracene	8310		
acenaphtalene	8310		
indeno(1,2,3-cd)pyrene	8310		
benzo(a)pyrene	8310		
Total polychlorinated dioxins	8280		
2,3,7,8-Tetrachlorodibenzo-p-dioxin	8280		
benzene	8020		

2.1 Monitoring

In order to monitor the biodegradation progress, Koppers periodically will analyze the soils and soil-pore liquids, for the indicator parameters described in section 1.0. Certification of closure will be pursued once it is determined that there is no appreciable difference between the sprayfield and background soil. Clean closure will be confirmed when all ten soil core samples are analyzed for the table 1.0 parameters and results fall within two standard deviations of the background analyses.

2.2 Decontamination or Disposal of Equipment

Once the sprayfield soils are determined to be clean or if the contingent plan is implemented, the piping for the water delivery system will be removed, cut into small pieces and disposed of in a proper manner.

2.3 Personnel Protection Area

The personnel protection area provided for the surface impoundment closure will also be used during the sprayfield closure. At a minimum, the area will include a clean change area, lockers and shower facilities.

3.0 Maximum Waste Inventory

Because the sprayfield receives only treated wastewater, it is difficult to predict the amount, if any, of residual constituents that may be present at the time of closure.

4.0 Closure Schedule

As of the date of preparation of this revised plan, an exact date has not been set

for the closure of the sprayfield. Initiation of closure is dependant upon the construction and start-up of the new wastewater treatment facility and the initiation of surface impoundment closure. Closure of the sprayfield will be initiated within sixty (60) days of final discharge to the sprayfield. Closure task durations are listed in Table 2.0.

The exact amount, if any, of residual contamination will determine the work effort required for closure and thereby affect the closure schedule. Also, adverse site weather conditions will likely delay the closure. Once the closure procedures detailed in this document are approved and the task durations are determined to be realistic, it may become apparent that an extension will be necessary. At this time, Koppers will request an extension.

VIII. Contingent Closure Plan

1.0 Elimination of Waste

Koppers plans to use the procedures previously discussed to decontaminate the sprayfield. However, if clean closure becomes impossible by the described method, the following activities will be implemented.

2.0 Excavation

Contingent closure of the sprayfield will be achieved by excavation of contaminated soils. The process will proceed as described in the surface impoundment closure plan. First areas proven to be contaminated during the site evaluation will be excavated, segregated and disposed of in an approved landfill.

3.0 Final Cover Design and Construction (Contingent Closure)

Contingent Closure of the sprayfield will be achieved by in situ capping after excavation of contaminated soils. The closure process will proceed as described in the surface impoundment closure plan. A clay barrier cap will be installed over all or a portion of the sprayfield if clean-closure is infeasible.

Revised 08/27/87

TABLE II

SCHEDULE FOR CLOSURE OF SPRAYFIELD

KOPPERS
SUPERIOR, WISCONSIN PLANT

TASK	DURATION
First soil sampling/analysis and lysimeter installation	Sept. 15 - Nov. 15, 1988
pH and nutrient adjustments Tilling and seeding; water system modifications	Oct. 15 - March 15, 1989
Second soils and soil pore liquids sampling/analysis	March 15 - May 15(1)
Evaluate and submit necessary data for regulatory concurrence of clean-closure	May 15 - Aug. 15
Decision to continue or, if necessary, contingent closure	---

(1) **Due to cold weather coditions, soil sampling will not continue through January and February.**

In Situ Capping

The subgrade within the sprayfield area will be proffrolled with a heavy rubber tired or tracked vehicle to stabilize the surface materials and locate any soft spots requiring additional work. The layers are to be applied in lifts approximately 6 to 8 inches in thickness and to be compacted with equipment that can produce or exceed the Standard Proctor Compaction energy. Soils should be within 2 percent of optimum moisture content to achieve desired density. Each lift will be compacted to 100 percent of the maximum dry density as determined by the Standard Proctor Compaction test (ASTM D-698). A field density and moisture content test will be conducted on each lift to verify that this degree of compaction is achieved. The final lifts are to be graded to contours that blend with the final contours of the surface impoundments.

A geotextile membrane will be placed on top of the first layer of fill to provide support to the impervious clay cap layer. The clay layer will be 24 inches thick and will have a minimum permeability of 1.0×10^{-7} cm/sec and will extend a minimum of 2 feet beyond the sprayfield boundary. The layer will be graded such that a 3 percent slope exist from a center line crown. The clay soils will be compacted to 100 percent of maximum dry density (ASTM D-698) at, or above the 2 percent optimum moisture content. Field density and moisture content test will be conducted on each lift to again verify that the proper degree of compaction is achieved.

A second geotextile membrane and a synthetic impervious liner will be placed on top of the clay cap. To collect the lateral drainage, a 4 inch perforated drain pipe will be provided around the periphery of the layer. Appendix C details the calculations that show the efficiency of the capping system. These calculations apply to both the surface impoundment cap and the sprayfield cap designs.

Attachment 2.0 illustrates a typical cross section of the closure cover for the surface impoundments and the sprayfield. Finally, an 18 inch layer of topsoil will be graded to a minimum of 3 percent and seeded with a non-food crop vegetative cover to prevent erosion. Sheet drainage from the sprayfield will be directed to existing and/or newly installed drain swales that will also accept the discharge of the 6 inch perimeter drain.

Seeding and fertilizing of the sprayfield area will be performed in conjunction with the seeding program for the surface impoundment closure.

IX. Post-Closure Requirements

If clean closure is not achieved by either biodegradation or excavation then, post-closure care will proceed as describe in section IX of the surface impoundment closure plan. Installation of additional monitoring wells in the sprayfield area may be implemented if deemed necessary at the time of closure.

X. Certification of Closure

Upon completion of closure, Koppers will submit to the WDNR a certification and construction documentation report by an independent state of Wisconsin registered engineer that the facility has been closed in accordance with the specifications of the approved closure plan. Koppers will maintain a copy of the approved Closure Plan and all revisions to the Plan until certification of closure completeness has been accepted by WDNR.

In order to expedite the certification process, Koppers may certify both the impoundment and sprayfield closure as one project. However, if timing of each program is such that this will delay the certification of either of the projects then Koppers may choose to certify each project individually.

XI Sampling and Analysis Plan

1.0 Introduction

This sampling and analysis plan provides guidance for monitoring the closure operations and confirming clean sprayfield closure at the Koppers Co., Inc., Superior, Wisconsin facility. Naphthalene, phenols and oil and grease will be used as indicator parameters to monitor closure progress. Final confirmation of clean closure will include all of the soil analyses found in Table 1.0 and the groundwater monitoring program already in-place at the site.

2.0 Soil Sampling

Soil sampling will consist of background, preliminary and final sprayfield samples. All samples will be taken by qualified sampling personnel and will be analyzed by an approved laboratory.

2.1 Background Soil Sampling and Analysis

Four background soil samples will be taken in an area that is upgradient and unaffected by site activities. The sample points will be located during an extensive site reconnaissance and will be submitted to the WDNR for approval prior to sampling.

Continuous samples will be taken using a two inch split spoon sampler and/or auger. If approved by the WDNR, these samples may be used for confirming clean closure of both the sprayfield and impoundments, as such, sampling would begin at the surface and continue to a depth four feet below the impoundment bottom. The sample would be separated into two parts to be representative of the sprayfield and impoundment soils. If use of the same background sample location for confirming clean closure of both the sprayfield and impoundments is not approved by WDNR,

then individual representative locations will be selected.

Samples will be analyzed for all of the parameters listed in Table 1.0. The respective EPA test method included in Table 1.0 and the QA/QC procedure in Appendix A will be followed.

2.2 Preliminary Sprayfield Sampling and Analysis

Preliminary sprayfield soil samples will be taken from the ten sample locations shown in Attachment 2.2. Borings will be to a depth of four feet with split spoon samples taken at 0-12, 12-24, 24-36, and 36-48 inches. The first two samples will be analyzed initially and the remaining will be analyzed as needed. Samples will be taken at the beginning, middle and end of the biorestoration process. Additional samples may be taken, if necessary, to monitor any excavation operations.

Samples will be analyzed for naphthalene, phenols and oil and grease following the QA/QC procedures in Appendix A and the respective EPA methodology listed in Table 1.0.

2.3 Confirmation of Clean Sprayfield Closure

The confirmation of clean sprayfield closure will involve both soil and groundwater sampling and analysis. Groundwater monitoring already in-place at the site should be sufficient to verify that no adverse groundwater effects are being caused by the sprayfield.

Soil samples will be taken at the same ten locations used for preliminary monitoring but with a 1/2 foot sampling interval for a total of four feet. The soil samples will be analyzed for the Table 1.0 parameters using the above mentioned protocol.

2.4 Equipment Decontamination Sampling and Analysis

Because most of the equipment used for closure activities will be used during the normal course of plant operation, visual verification of clean is sufficient to place it back into service. Expendible equipment will be disposed of in an appropriate manner.

2.5 Surface Water Sampling and Analysis

Impoundments and sprayfields are designed to prevent run-on and run-off which eliminates any surface water pathway for contaminant migration. For this reason, no surface water sampling and analysis is required.

APPENDIX D

SAMPLING AND ANALYSIS PLAN
KOPPERS COMPANY, INC.
SUPERIOR, WISCONSIN

Revised 08/27/87

1.0 Introduction

This sampling and analysis plan provides guidance for monitoring the closure operations and confirming clean impoundment and sprayfield closure at the Koppers Company, Inc., Superior, Wisconsin facility. Napthalene, phenols and oil and grease will be used as indicator parameters to monitor closure progress. Final confirmation of clean closure will include all of the soil analyses found in Table 1.0 and the groundwater monitoring program already in-place at the site.

2.0 Soil Sampling

Soil sampling will consist of background, preliminary and final impoundment samples. All samples will be taken by qualified sampling personnel and will be analyzed by an approved laboratory.

2.1 Background Soil Sampling and Analysis

Four background soil samples will be taken in an area that is upgradient and unaffected by site activities. The sample points will be located during an extensive site reconnaissance and will be submitted to the WDNR for approval prior to sampling.

Continuous samples will be taken using a two inch split spoon samples and/or auger. Sampling will begin once the elevation of the impoundment bottom is reached and will continue for an additional depth of four feet. If approved by the WDNR, these samples may also be used for confirming clean closure of the sprayfield and, as such, sampling would begin at the surface and continue to a depth four feet below the impoundment bottom elevation. Each sample would be separated into two parts to be representative of the sprayfield and impoundment soils. If use of the same background sample location for confirming clean closure of both the sprayfield and impoundments is not approved by the WDNR, then individual

representative locations will be selected.

Samples will be analyzed for all of the parameters listed in Table 1.0. The respective EPA test method included in Table 1.0 and the QA/QC procedure in Appendix A will be followed.

2.2 Preliminary Impoundment Soil Sampling and Analysis

Preliminary impoundment soil samples will be taken from the sample points located on the map in attachment 2.2. Five samples are to be taken from each impoundment bottom and one sample from each dike wall of each impoundment. The dike wall samples will be horizontal borings. Both the dike wall and bottom borings will be for four feet with samples taken at 0-12, 12-24, 24-36 and 36-48 inches. The 0-12 and 12-24 inch samples will be analyzed first and the remaining samples will be analyzed later, if necessary, to determine the extent of contamination.

All samples will be analyzed for napthalene, phenols and oil and grease. These parameters were chosen because they are representative of K001 sludge and should be a good indication of the extent of contamination. Again, the QA/QC procedure in Appendix A and the respective EPA test method listed in Table 1.0 will be used.

2.3 Confirmation of Clean Impoundment Closure

The confirmation of clean impoundment closure will involve both soil and groundwater sampling and analysis. Groundwater monitoring already in-place at the site will be used to demonstrate that the impoundments are causing no adverse effect on the groundwater. Additional soil sampling and analysis will be required.

Soil samples will be taken at the same locations used for preliminary evaluation and from eight additional locations. The additional sample locations are also shown

on the site map in Attachment 2.2. Nine bottom borings and four sidewall borings will be made in each impoundment. Two inch split spoon samples will be taken at 1/2 foot intervals for a total of 4 feet.

Samples will be analyzed for all of the parameters listed in Table 1.0.

2.5 Water Sampling and Analysis

Groundwater sampling and analysis plans are detailed in Section IX Part 3.0.

Impoundments and sprayfields are designed to prevent run-on and run-off which eliminates any surface water pathway for contaminant migration. For this reason, no surface water sampling and analysis is required.

2.6 Sludge Sampling and Analysis

A grab sample of the impoundment sludge will be taken and analyzed prior to disposal to verify that the sludge can be designated a K001 waste. The sludge sample will be analyzed for polynuclear aromatic hydrocarbons (PAH), phenols and pentachlorophenol, which are the primary constituents of K001. The following analytical methods will be used:

- PAH -- EPA 8100
- Phenol -- EPA 8040
- Pentachlorophenol -- EPA 8040

SUBJECT: Hazardous Waste Closure and Long-Term Care Plan
Conditional Approval
Koppers Co., Inc. - Surface Impoundment
EPA ID: WID006179493

Dear Mr. Batchelder:

The Department of Natural Resources has completed its review of your report entitled "Closure and Post-Closure Plan for the Koppers Co., Inc. Hazardous Waste Management Facility, Superior, Wisconsin - Surface Impoundments, EPA ID. No. WID006179493". This report was prepared by Keystone Environmental Resources, Inc. of Monroeville, Pennslyvania and submitted on June 1, 1987 with revisions received on August 28, 1987. We are informing you that your closure and long-term care plan is conditionally approved. Based on our review, we have determined that the closure and long-term care plan requirements found in ch. 181, Wis. Adm. Code will be adequately addressed, provided the conditions set forth in the attached approval report are met.

The conditions of approval are necessary to insure that the construction, closure and long-term care activities called for in the closure plan are properly designed and implemented. Prior to any construction activities being initiated on any of the items discussed in the closure plan, all conditions associated with that construction activity shall be addressed to the Department's satisfaction. All contractors at the site shall be provided with a copy of this conditional approval as part of their contract document. Please review this approval report carefully.

5910

If you have any questions regarding the conditional approval, please contact Ed Lynch at (608) 266-3084.

Sincerely,

Paul P. Didier

Property Owner and Operator:

Koppers Company, Inc.
436 7th Avenue
Koppers Building
Pittsburg, PA 15219

Location of Site:

The Koppers facility is located approximately 2 miles southeast of Superior, Wisconsin in sections 12 and 13, T48N, R13W, Town of Superior, Douglas County. The site is located adjacent to the intersection of Hwys. A and Z.

Report Prepared by:

Robert J. Anderson, Environmental Program Manager
Ronald M. Morosky, Project Manager
Keystone Environmental Resources
440 College Park Drive
Monroeville, PA

Site Description:

Koppers Company, Inc. began operation at its Superior facility in 1928. The entire site occupies approximately 112 acres. The wood treating facility and waste handling facility are located on a smaller portion near the northern end. The majority of the site is used for storage of treated and untreated wood. Currently, the plant uses creosote for the pressure treatment of railroad cross ties. The use of pentachlorophenol (PCP) preservative was

discontinued in the early part of 1982. Other wood products, such as coals and pilings may also be produced.

The surface impoundments were constructed in the mid-1970's. The only hazardous waste generated is K001 waste (bottom sediment sludge from the treatment of wastewaters from wood preserving processes using creosote or pentachlorophenol). The surface impoundments are preceeded by oil/water separation and flow equalization. Hydrocarbon material removed prior to the surface impoundments is reused in the wood treating process. As such, the amount of contaminants that flow into the surface impoundment is minimized.

Each impoundment is a regular shaped rectangle which measures approximately 127 feet by 170 feet on the inside top of the dike measurement. The bottom of the impoundments are about 7 feet below the top of the dike with side slopes of about 3 horizontal to 1 vertical (3:1). The total bottom area of each lagoon is roughly 40,672 square feet and the maximum hydraulic volume is 294,550 cubic feet (2,203,234 gallons). The facility is located in an area generally designated for agricultural use.

Site Geology

The geologic materials beneath the Superior site vicinity consists of a thick section of Pleistocene with some Holocene age sediments overlaying Precambrian bedrock. The top of the bedrock underlying the Superior, Wisconsin area is reported in local water well logs to be between 170 to 210 feet below the land surface. The bedrock consist of flat-lying quartz sandstone.

The Pleistocene section consist of the Copper Falls and Miller Creek formations (Mickelson, et al., 1984). The Copper Falls formation is found approximately 100 feet to 140 feet below the land surface with an average thickness of 40 feet. The Miller Creek formation overlies the Copper Falls and consist of those materials from the ground surface to a depth of approximately 100 feet to 140 feet.

The Copper Falls formation consists of reddish to brownish sandy sediment. The majority of the Copper Falls consist of sandy till. However, a large amount of sand and gravel deposited by glacial meltwater streams occur interbedded with in the till deposits.

The Miller Creek formation consists predominantly of red clay till. However, up to approximately one-quarter of the formation probably consists of bedded reddish silt and clay deposited in glacial lakes. It occurs interbedded within the till. Small amounts of interbedded sand and gravel also occur. The Miller Creek formation consists of two members; the Hanson Creek Member (lower) and the Douglas Member (upper).

Both are composed predominantly of clay till. However, the Hanson Creek till is siltier and browner than the Douglas till. The blue green clay unit identified in the local water supply well logs may be the upper most portion of Hanson Creek Member. It may be a lake bed deposit that was exposed when lake levels decreased and clay was subject to drying.

On-site geologic investigations of the site conducted by GAI Consultants in 1985 describe the subsurface geology as lake bed deposits composed of unlaminated red-brown clay containing discontinuous layers of silt and sand. Ten soil borings were drilled to variable depths, each terminating in red-brown clay. The borings ranged in depth from 30 to 60 feet. The clay was probably deposited by glacial ice rather than within a lake because it is unlaminated.

The following characteristics were observed in the underlying deposits. The upper (0 to 5 feet) consist of fill material deposits and topsoil. Underlying the fill is red-brown highly plastic, unlaminated clay, with thin vertical, hairline fractures in-filled with a greenish-gray clay-like material. The fractured clay continued to a maximum depth of 18 feet, but generally was less than 15 feet.

Below the fractured clay, a similar red-brown highly plastic, unlaminated clay was present ranging from 15 feet to further than 60 feet below the surface. Fractures and the gray clay in-fillings were absent. Very little organic matter was detected. Where sand, silt or gravel layers were not detected the clay continued to the bottom of all borings.

Eight of the soil borings encountered variable amounts of sand, silt and gravel deposits within the unfractured clay. The sand was multicolored, subangular and generally poorly sorted with samples exhibiting layers or bedding. The sand found between 35 feet and 45 feet depths exhibited fining up sequence with gravel on the bottom grading to a coarse to medium sand with fine sand and silt on top. The sandy units had a variable range in thickness of 1 inch to 10 feet. Two soil borings encountered only trace amounts of these deposits.

Below and between the sandy units the red-brown highly plastic, unlaminated, unfractured clay was observed. The bottom of the clay unit was not detected by these soil borings.

A recent regional study of the area by Clayton (1984) reported the clay sequence to be part of the Douglas till. The till was described as red-brown clay deposited during the end of the Wisconsin glacial stage.

Site Construction:

The goal of this closure activity is to remove all hazardous wastes and contaminated soils from the area where the surface impoundments are located and thereby achieve clean closure (Section V). In the event all wastes or contaminated soils cannot be removed, then the site will be closed in accordance with the requirements for a hazardous waste landfill and the site will be capped. Closure activities will begin in April 1988 and be completed by October 1989 (Attachment 5.1-1; Section VI).

Closure of the surface impoundments at the site include removal of all free liquids from them, removal of all K001 bottom sediment (sludge) and as much contaminated soil as feasible. It is anticipated that approximately 300 cubic yards of sludge is present and that approximately 1,900 cubic yards of

contaminated soil will be removed. This hazardous waste will be shipped to an engineered, secured hazardous waste landfill.

Once the hazardous waste and contaminated soils have been removed, a preliminary soil investigation (Section VII) will be conducted to determine the extent and existence of any residual hazardous contaminants. The results of the preliminary investigation will be used to decide whether to pursue a clean closure. If a decision is made to pursue clean closure additional soil sampling will take place. If clean closure is achieved, then existing perimeter fencing will be removed, and the surrounding berms will be excavated. The impoundment excavation will be backfilled with unclassified soil fill paced in 8 inch lifts and compacted to 95% density. Following fill placement, an 18 inch thick topsoil material will be placed above the soil fill. The site will then be raked, seeded and mulched to minimize erosion. Plan sheet A103034 shows final grades for a clean closure.

If clean closure cannot be achieved, then the contingent closure plan must be implemented. The contingent closure (Section VIII) calls for backfill of the surface impoundment excavation with unclassified soil material (predominantly cohesive soils) to a specified grade. A non-woven geotextile will be placed above the soil fill. A composite cap will then be laced over the site. This cap will consist of a clay barrier with a minimum thickness of 24 inches, a synthetic flexible membrane liner (FML), a non-woven geotextile, a drainage layer with a minimum thickness of 12 inches, a non-woven geotextile, suitable unclassified cohesive fill with a minimum thickness of 30 inches, and a topsoil layer with a minimum thickness of 18 inches. The cap will be graded to a minimum 3% slope and be raked, seeded, and mulched to minimize erosion. Total cap thickness will be at least seven feet thick. Plan sheet A103032 shows final grades for closure using the contingent closure plan.

Long Term Care:

The long term care period for this facility is 30 years commencing from the date of Department approval of the construction documentation submittal. The post closure activities include inspections and maintenance of the site, inspection and maintenance of the groundwater monitoring system and implementing the groundwater monitoring plan. Requirements of the groundwater monitoring plan may be reduced in the future.

FINDINGS OF FACT

The Department finds that:

1. Koppers Co., Inc. owns and operates a hazardous waste facility in Section 12 of T48N, R14W, Town of Superior, Douglas County, Wisconsin. The current surface impoundments and spray irrigation field has been used since the mid 1970's.

2. Koppers Co., Inc. submitted to the U.S. EPA a Resource Conservation and Recovery Act (RCRA) notification form informing EPA of hazardous waste generation, transportation and storage activities at their Superior,

Wisconsin facility on August 18, 1980. Koppers submitted a RCRA Part A application on November 18, 1980 and was subsequently granted interim status to store hazardous waste by U.S. EPA.

3. The Department reviewed the Koppers Co. RCRA Part A application and accompanying material that compromised the ch. NR 181, Wis. Adm. Code, interim license application and granted Koppers an interim license on April 1, 1985.

4. On April 1, 1985 the Department "called in" the Koppers Co. Feasibility Report for the surface impoundments and container storage area. The Feasibility Report was due on December 31, 1985.

5. The hazardous waste surface impoundments are subject to the Landfill and Surface Impoundment Standards found in s. NR 181.44, Wisconsin Administrative Code and Groundwater and Leachate Monitoring Standards found in s. NR 181.49, Wisconsin Administrative Code.

6. On January 2, 1986, Koppers Co. submitted a feasibility report for the hazardous waste surface impoundments and container storage facility. Numerous revisions to report were made in response to Department notices of the completeness.

7. On September 5, 1986, Koppers Co. withdrew the feasibility report for the surface impoundments and on September 23, 1986 notified of their intent to close the surface impoundments.

8. The information submitted in connection with the closure and long-term care plan review includes the following:

   a. The "Closure and Post Closure Plan for the Koppers Co., Inc. Hazardous Waste Management Facility - Superior Wisconsin" submitted on June 1, 1987 with revisions received on August 28, 1987. Prepared by Keystone Environmental Resources, Monroeville, Pennsylvania.

   b. The "Koppers Co., Inc. Closure Plan - Surface Impoundments - Spray Field - Superior, Wisconsin" submitted on December 18, 1986. Prepared by Koppers Co., - Pittsburgh, Pennsylvania.

   c. The "Feasibility Report - Koppers Co., Inc. - Superior, Wisconsin" covering the surface impoundments and container storage submitted on January 2, 1986. Prepared by Woodward-Clyde Consultants, Chicago, Illinois.

   d. The " Geology and Groundwater Hydrogeology Investigation for Koppers Co., Inc., Wood Treating Plant, Superior, Wisconsin" submitted on January 3, 1986. Prepared by Woodward-Clyde Consultants, Chicago, Illinois.

9. Department and related correspondences/documents considered in review of the closure and post-closure plant.

   a. The Department's July 28, 1987 closure plan notice of incompleteness.

b. The Department's April 1, 1987 closure plan notice of noncompliance.

c. Other Department correspondence to Koppers dated January 26, 1986, August 4, 1986, and April 11, 1986, Department memorandums dated March 26, 1987 and July 24, 1986, and related file material.

d. Chapter NR 181, Wisconsin Administrative Code

CONCLUSIONS OF LAW

1. The closure and long-term care plan has been prepared in accordance with applicable Wisconsin Statutes and Administrative Codes. The Department has the authority to determine closure, long-term, and termination standards for hazardous waste facilities pursuant to ss. 144.441(1m) and 144.62(8)(e), Stats. These requirements are listed in ss. NR 180.42(8) and (9) and 181.44(12) and (14) and 181.49, Wis. Adm. Code.

2. Koppers Co., Inc. is an existing hazardous waste facility as defined in s. 144.61(5m), Stats., and operates a hazardous waste surface impoundment as defined in s. NR 181.04(94), Wis. Adm. Code.

3. Listed hazardous wastes as defined in s. NR 181.16, Wis. Adm. Code are stored in the Koppers Co., Inc. surface impoundment. Hazardous waste means any solid waste as defined by the Department as hazardous under s. 144.62(2), Stats., and is defined in s. NR 181.12, Wis. Adm. Code.

4. Section 144.64(2)(c), Stats., allows the Department to issue an interim license to the owner or operator of the hazardous waste facility in existence on November 19, 1980 if the person applies for a license and complies with the restrictions prescribed by rule or special order by the Department pending the decision on the issuance of a final operating license. Koppers Co., Inc. was granted an interim license by the Department on April 1, 1985.

5. Section NR 181.42(8)(d), Wis. Adm. Code, requires the Department to approve, deny or modify a closure plan. The Koppers Co., Inc. Closure and Long-Term Care Plan, as modified by the conditions of this approval, meets the requirements of ss. NR 181.42(8) and (9) and ss. NR 181.44(12) and (14), Wis. Adm. Code. The closure and long-term care plan as conditionally approved will comply with those sections.

6. The environmental monitoring program as conditionally approved in the closure and long-term care plan will comply with the groundwater monitoring requirements of s. NR 181.49, Wis. Adm. Code.

CONDITIONS OF APPROVAL

General

1. All site construction, documentation and closure and post closure activities of the Koppers Co., Inc. surface impoundments shall be in accordance with the Revised Closure and Post-Closure Plan and accompanying plan sheets of engineering drawings as prepared by Keystone Environmental

Resources, ch. NR 181, Wisconsin Administrative Code and the Conditions of Approval contained in this Conditional Approval Report. In the event of any discrepancies, the Conditions of Approval contained herein shall take precedence. Any proposed changes to the closure and post-closure plan or this approval shall be presented to the Department in writing. If the Department feels these changes are compatible with the proper closure and long-term care of the site, an addendum will be added to this approval indicating acceptance of those changes. Department approval is necessary prior to implementation of any changes.

2. A copy of the Modified Closure and Long-term Care Plan and a set of engineering drawings and this modified approval shall be retained at the facility's office at all times and shall be used by the individuals responsible for proper closure and long-term care of the surface impoundments. Individuals responsible for construction, closure and long-term care shall be informed of the conditions required in this approval. A copy of this conditional approval and report shall be included with all contractor construction documents.

3. The Department reserves the right to require changes to any conditions of this approval should an evaluation of the groundwater monitoring results, construction documentations or site inspections by District or Bureau staff reveal that changes are necessary.

4. All reports and investigations called for in this approval shall be prepared by a Professional Engineer registered in the state of Wisconsin. Koppers Co., Inc. shall submit all these reports and investigations called for in this approval in a timely fashion on the dates stated herein.

5. The schedule of events leading to closure of the surface impoundments are included in this condition. If for any reason Koppers Co., Inc. cannot meet the dates of this schedule, the Department shall be notified in writing why the action has not been completed.

Schedule For Closure of Surface Impoundments

Task	Duration
1988	
Preliminary removal standing liquid	April 1 - Aug. 15,
Wastewater treatment system start-up and final receipt of waste in surface impoundments	Aug. 15 - Aug. 25,
Final removal of standing liquid	Aug. 25 - Sept. 15,
Accumulate and remove K001 sludge	Sept. 15 - Oct. 15,
Remove visibly contaminated subgrade soil	Oct. 15 - Nov. 15,

Impoundment subgrade preliminary soil sampling/analysis	Oct. 15 - Nov. 15,
Background soil sampling/analysis	Oct. 15 - Nov. 15,
1989	
Evaluate data and decide to pursue clean or contingent closure	Nov. 15 - Feb. 15,
If clean closure, sample and analyze for Table 1.0 parameters	Feb. 15 - May 15,
Regulatory response	May 15 - June 15,
If clean closure: Remove additional subgrade (if if necessary), backfill, cover, seed and decontaminate equipment	June 15 - Sept. 15,
If contingent closure: Backfill, cover (RCRA cap) seed and decontaminate equipment	June 15 - Sept. 15,
Completion of Closure Certification	Sept. - Oct. 15,

6. Any well that is abandoned as a result of closure shall be abandoned in accordance this condition. Proper abandonment of monitoring devices shall seal the well completely in order to prevent future contamination of groundwater. The sealing materials used shall be continuous, physically and chemically stable and have a hydraulic conductivity of less than 1 x 10^{-7} cm/sec. The exact location of abandoned wells and borings and the date and the method of abandonment shall be documented in writing. The abandonment method shall also be documented by photographs. All monitoring wells shall be abandoned and documented in accordance with ss. NR 141.25, Wis. Adm. Code. A report documenting that the monitoring devices have been properly abandoned shall be submitted with the construction documentation report.

7. Koppers Co., Inc. shall have a competent resident inspector on site during the entire closure period.

8. Koppers Co., Inc. shall inform the Department of any hazardous waste treatment activities that occur on site during closure. This includes the treatment of any K001 sludge by mixing with flyash or kiln dust. The Department shall be provided with a specific treatment plan which covers treatment location, treatment type, treatment structure and mixing ratio between the sludge and absorbant material.

9. Koppers Co., Inc. shall provide the Department with all sampling and analytical results from the soil investigations done to determine if clean closure is feasible.

10. Koppers Co., Inc. shall contact the Department for approval of the location of the background soil borings.

Groundwater Monitoring and Long-term Care Conditions

11. Koppers Co., Inc. shall submit the results of the annual analysis report required by s. NR 181.49(6)(j)6., Wis. Adm. Code, for its entire groundwater monitoring system as soon as they become available.

12. Koppers Co., Inc. shall maintain a groundwater monitoring plan as required by s. NR 181.49, Wis. Adm. Code. The following wells will be the ch. NR 181, Wis. Adm. Code, monitoring wells.

Upgradient (Background)	Downgradient	
W-4A	L-1S	R-5D
W-4B	L-2S	R-6D
W-4C	L-4S	L-4D
	W-5	R-7D
		R-8D (W-6)
		R-9D

A well information form is needed for well R-5D, when that well is constructed.

13. Wells W-5, R-5D, R6-D, R-7D and R-9D must be sampled for the entire s. NR 181.16 Table VI (40 CFR Appendix IX is acceptable), hazardous constituents list.

To determine the existing level of Table VI (Appendix IX) constituents present in the groundwater, all wells will then be monitored an additional three times (on a monthly basis for all detected Table VI (Appendix IX) constituents, hazardous constituents listed under EPA hazardous waste number K001, indicator parameters, and several welfare parameters. This shall include the following:

Parameters

Indicator and Welfare Drinking Water Standards	Hazardous Constituents For Which K001 is Listed	Detected Table VI Hazardous Constituents
pH	Pentachlorophenol	Methylene Chloride
Conductivity	Phenol	Acetone
Temperature	2-Chlorophenol	Bis (2-Ethylhexyl)-phthalate
		Aluminum
Total Dissolved Solids	P-Chloro-M-Cresol	Arsenic
Hardness	2,4-Dimethylphenyl	Cadmium
Nitrate	2,4-Dinitrophenol	Calcium
Chloride	Trichlorophenol	Chromium
Ammonia	Tetrachlorophenol	Chromium
Total Organic	Creosote	Cobalt
	Chrysene	Copper

Carbon	Naphthalene	Iron
Chemical Oxygen	Fluoranthene	Lead
Demand	Benzo (b) Fluoranthene	Manganese
	Benzo (a) Pyrene	Nickel
	Indeno (1,2,3-cd) Pyrene	Potassium
	Benz (a) Anthracene	Selenium
	Dibenz (a) Anthracene	Sodium
	Acenciphthalene	Vanadium
		Zinc

In addition, there have been Table VI (Appendix IX) detects upgradient in the background wells. Koppers Co., Inc. must determine the source of the constituents in these wells as it is unlikely these wells are influenced by the surface impoundments.

14. All samples collected for laboratory analysis shall be filtered in the field using a 0.45 micron inline filter unless otherwise approved by the Department. It appears that the analyses for inorganic Appendix IX parameters were performed on unfiltered samples, because the concentrations were extremely high (for example, iron averaged approximately 94 mg/l). If subsequent sampling rounds show that the actual concentrations of any of these metals at the facility are within the limits that can reasonably be expected in this clay environment, upon the request of Kopper's, the Department will drop those metals from the required list of parameters in Condition 13.

15. Once Koppers Co., Inc. has completed the analysis, a background value for each constituent detected must be established. This information must be submitted to the Department for review and concurrence. Once background has been established, the Department will establish groundwater protection standards for each detected constituent.

16. Background values for the parameters listed in Condition 13 shall be calculated by using 4 rounds of dated collected from wells unaffected by the site. In the past it appeared that wells W-4A, W-4B, and W-4C would be suitable background wells. However, hazardous constituents have been detected in these wells. Though they may not have been impacted by the surface impoundments, they probably do not represent background conditions.

17. Once site background has been established, samples shall be collected quarterly from each upgradient and each downgradient well analyzed for the parameters listed in Condition 13, the background data to determine whether any statistically significant different exists. The data and the test calculations shall be submitted to the Department quarterly. As proposed by Koppers, the Cochran's approximation to the Behrens - Fisher student's t-test shall be used to perform the statistical comparisons. The procedures described in NR 181.49(6)(h)1.a., Wis. Adm. Code. Upon written request from Koppers Company, the Department will consider approving a statistical test which requires 1 lab analysis per well per quarter rather than 4 analyses as required by the Cochran's approximation to the Behrens - Fisher student's t-test.

18. Groundwater elevations shall be measured in all monitoring wells on a quarterly basis. The measurements shall be made before the wells are purged or sampled.

19. Koppers Co. Inc. shall monitor all ch. NR 181, Wis. Adm. Code, compliance monitoring wells listed in Condition 12 for detected parameters on a quarterly basis and compare them to background. If a groundwater protection standard is exceeded, then Koppers Co., Inc. shall notify the Department and propose a corrective action program as outlined in s. NR 181.49(6)(j), Wis. Adm. Code.

20. Koppers Co., Inc. shall submit a revised ch. NR 181, Wis. Adm. Code groundwater monitoring plan reflecting these conditions and the requirements of s. NR 181.49(b) must be submitted within 45 days of the date of this approval. Koppers Co., Inc. may suggest minor revisions to these conditions in that plan submittal.

Financial Responsibilities

21. If clean closure cannot be attained and the contingent closure plan is implemented, Koppers Co., Inc. shall submit a long-term care plan specifying the inspection, maintenance and care of the facility during its 30 year post-closure care period.

22. Closure and Long-Term Care (NR 181.42(10), WAC).

    The closure costs presented are underestimated due to conditions of this closure plan. Revised cost estimates based upon the cost of closing the surface impoundments in accordance with the conditions of this closure and long-term care plan must be submitted. These costs must assume the most expensive closure will take place. The long-term care cost estimate must be covered in the proof mechanism. The revised cost estimates and proof mechanism shall be submitted within 45 days of the date of this approval.

23. Liability Requirement (NR 181.42(11), WAC)

    Koppers Co., Inc. must obtain liability insurance coverage for non-sudden accidental occurrences in the amount of $3 million per occurrence with an annual aggregate of at least $6 million, exclusive of legal defense costs. As part of the revisions to ch. NR 181, Wis. Adm. Code, a financial net worth test may be used. Koppers Co. is responsible for having this coverage now and proof of coverage must be submitted within 45 days of the date of this letter.

Construction Documentation

24. A Construction Documentation Report verifying and documenting all aspects of site construction shall be prepared following completion of construction. The report shall include the following information at a minimum:

a. Plan sheets documenting: the extent of excavation and fill, all groundwater monitoring devices; grade and sidewall elevations of the cap including spot elevations; the location and types of testing performed; the locations of drainage ditches, access roads, berms; and any other pertinent information. In addition, invert elevations shall be provided on all gradient control and collection pipes.

b. Cross-sections shall be constructed to document the certified area. The drawings shall consist of a minimum of one north-south cross-section and one east-west cross-section. The cross-sections shall include base grades and final grades.

c. A comprehensive narrative explaining how construction of the project was accomplished along with an analysis of the data obtained during the soil investigation program. This report shall also include an appendix containing all the raw data from the field and laboratory soil testing performed.

d. A series of 35 mm color prints documenting all major aspects of site construction.

e. A letter under the seal of a registered professional engineer certifying that the site has been constructed in substantial compliance with the approved plans. Any deviations from the approved plans shall be noted.

Contingent Cap

25. The cap shall be constructed in accordance with the design specified in the closure and long-term care plan and the engineering plan sheets and as modified by the conditions of this approval. The cap shall consist of non-woven geotextile, a minimum 2 foot thick recompacted clay layer, a non-woven geotextile, a flexible membrane liner consisting of 40 mil high density polethylene (HDPE), a minimum 1 foot thick granular drainage layer, a non-woven geotextile, a minimum of 2.5 foot thick soil fill layer and a minimum 1.5 foot thick layer of topsoil. The final cover will be seeded, fertilized and mulched.

26. The flexible membrane line (FML) shall be at a minimum 40 mil high density polyethylene (HDPE) and not polyvinyl chloride (PVC). The FML shall be designed, tested and installed as specified in conditions.

27. Documentation Testing for The Clay Cap Shall be as Follows:

    a. Density testing shall be performed on a 100-foot grid pattern for each lift with the grid pattern offset on each subsequent lift. A lift shall not exceed eight inches in thickness after compaction. At least five densities shall be conducted per lift for each acre of clay placed. The testing locations shall be offset on each successive lift.

b. A minimum of one undisturbed soil sample per 1,000 cubic yards shall be retrieved and analyzed for Atterberg limits, grain size (to the two micron particle size), moisture content, and dry density. Laboratory hydraulic conductivity tests shall be performed on at least one undisturbed sample.

c. A Modified Proctor curve shall be developed for the clay and again if visible changes in soil quality are observed in order that density testing can be correlated to the appropriate soil type.

d. The clay component, drainage blanket, cover material and topsoil thickness shall be verified on a 100 foot grid pattern. This may be satisfied with a survey after each increment of construction.

Material Specifications

28. Clay

The clay cap shall meet the following specifications:

Classification:	CL or CH under the Unified Soil Classification System
Thickness:	Minimum of 2 feet for the cap
Permeability:	Less than or equal to $1x10^{-7}$ cm/sec.
Liquid Limit:	30% or greater
Plasticity Index:	15% or greater
Compaction:	95% standard Proctor
Grain Size:	P200 Content of 50% by weight or greater

Documentation testing of the final clay capping material shall be as follows:

a. Three density tests per acre per lift.

b. One undisturbed soil sample per acre shall be retrieved and analyzed for grain size, Atterberg limits, moisture content, dry density and permeability.

c. Verification of clay cap thickness on a 100-foot grid pattern.

d. A standard Proctor curve shall be developed for each major soil type in order that density testing can be correlated to the appropriate soil type.

29. Drainage Layer

A minimum 1 foot thick granular drainage blanket shall be placed over the membrane. The drainage materials shall meet the following specifications:

a. Grain size; P200 content of 5% or less,

b. Permeability: $1x10^{-3}$ cm/sec or greater,

c. Verification of drainage layer thickness on a 100 foot grid pattern,

d. Two permeability tests to document the permeability, and

e. Uniformity Coefficient: 6 or less.

30. Topsoil and Seed Mixture

Documentation testing of topsoil, seed, fertilizer and mulch placement shall consist of the following:

a. One grab sample of topsoil per acre shall be analyzed for soil pH and classified under the USDA soil classification system.

b. Verification of thickness on a 100-foot grid pattern.

c. The amount and type of fertilizer, seed and mulch used per acre.

d. A short narrative which explains how the seed bed was prepared and a summary of how placement of the seed, fertilizer and mulch were accomplished.

e. A series of 35 mm slides or color prints which document the work.

HDPE Membrane Requirements

31. The Department shall be notified in writing of the identities and qualifications of the geomembrane supplier, membrane installation contractor, and any other contractors involved in the project as soon as they are selected. The geomembrane information must be approved by the Department prior to implementing any membrane-related work. The following minimum information shall be included:

a. Identification of polymers and admixtures, quality control for the raw materials, fabrication methods, and quality control of geomembrane panels prior to shipment. Include sources of resins, all compounding materials, panel fabricators, and specific factory testing and seaming methods, as applicable, with detailed description of the processes.

b. Quality control for transporting and storing the membrane panels.

c. An experience record of the installer including contacts for projects previously completed within the last five years, including name, address, and phone number of contacts, type of application, and acreage completed.

d. The proposed equipment to be used in membrane installation, including machinery used in panel layout, sand drainage blanket placement, membrane seaming and testing, and soil processing.

e. Quality control for seams, including identification of the destructive and nondestructive testing equipment with standards which define seam failure.

32. Koppers Co., Inc. shall provide for Departmental review a fabrication plan prior to commencing installation of the membrane liner. The fabrication plan shall include the following:

a. Size and configuration of all panels to be assembled with a panel identification scheme.

b. General location and type of all seams.

c. Construction details for all membrane related work, including:

i. Minimum panel overlap,

ii. Penetration and attachment details for any points of membrane puncture, and

iii. Panel anchoring methods.

33. Upon receipt of all HDPE membrane, Koppers Co., Inc. shall obtain samples as specified and test the samples for the following chemical and physical properties as specified to verify that the correct material has been delivered. Representative samples shall be taken from each membrane thickness. Data should be recorded and reported to the Department with the site construction documentation report.

a.	Thickness:	1 per 50,000 ft^2
b.	Density:	1 per 50,000 ft^2
c.	Melt Index:	1 per 50,000 ft^2
d.	Tensile and Elongation Properties (include copies of stress-strain diagrams from lab)	ASTM D638 2 per lot (for each thickness)
e.	Modulus of Elasticity (include copies of stress-strain diagrams from lab)	ASTM D882 2 per lot (for each thickness)
f.	Environmental Stress Crack	ASTM D1693 (Five samples from the polymer used to fabricate the geomembrane)

HDPE Site Construction

34. Installation of the HDPE membrane shall not proceed at temperatures below 40°. There shall be no seaming of the HDPE during rainy weather.

35. Field seaming shall be performed by qualified seamers under the director supervision of a master seamer. The master seamer shall have experience seaming or performing quality control on a minimum of 1,000,000 square feet of HDPE membranes of 40 mil or greater thickness using the proposed field seaming method.

36. All geofabric installed in the site which will be exposed to sunlight for more than five days shall be UV resistant. Documentation of the fabric's UV resistance shall be included in the construction documentation report.

HDPE Quality Control

37. Destructive and nondestructive seam testing on all HDPE membrane installation shall be performed on the seams as follows:

    a. Nondestructive seam testing shall be performed on all seams over their full length and on all areas that have been repaired or where the membrane has been penetrated.

    b. Nondestructive same testing shall be performed using the vacuum test method or other method approved by the Department.

    c. Test seams for each seaming machine shall be made once each day at a minimum. Each seamer shall perform at least one test seam each day. A portion of each test seam shall be tested in the field for shear and peel and the other portion sent to a laboratory for testing.

    d. Field tests shall be performed using standardized specimen sizes in tensile testing machines with quantitative recording of test results.

    e. The test seam sample sent to the laboratory shall be labeled with a date, ambient temperature, seamer, and whether the test seam passed the field test.

    f. The test seam samples sent to the laboratory shall be tested for:

Peal Adhesion	ASTM D413
Bonded Seam Strength	ASTM D3083

38. Daily inspector's summary reports shall be prepared for each day that significant construction is either attempted or accomplished at the site. The reports shall described construction practices employed for membrane installation, collection piping placement, sand blanket placement and revegetation work accomplished. Outline drawings on 8 1/2" by 11" paper shall be prepared as necessary to record construction progress. The reports shall contain the following information:

    a. Amount and location of membrane placed. Changes from the fabrication plan should be noted.

    b. Identification of the panel numbers for the panels installed.

c. Location of field seams completed.

d. Results of test seams.

e. Location and results of nondestructive seam testing.

f. Location of repairs made and results of the nondestructive testing of these repairs.

g. Location of samples taken for destructive testing.

39. A construction documentation report shall be submitted to the Department for review and approval. This shall be submitted with other construction documents. The site construction documentation report must be signed and stamped by a professional engineer registered in Wisconsin and an opinion given as to whether the site has been constructed in substantial compliance with the approved plans. The report shall include:

a. Plan view(s) utilizing a one foot contour interval and showing the location of all items constructed with spot elevations shown for the actual grades implemented on approximate 100 foot intervals.

b. Plan view(s) of piping layout used with spot elevations provided.

c. Results of the chemical and physical testing performed on the membrane as designated in Condition 33.

d. Location, type, manufacturer, trade name, quantity and installation methods for any geotextiles used. A sample of each geotextile used shall be included in the construction documentation report.

e. Copies of the daily field installation reports kept throughout construction.

f. A series of 35 millimeter photographs documenting all aspects of site construction and membrane placement with photos of all points of membrane penetration.

g. Cross-section drawings, one lengthwise and one crosswise through the cap showing membrane placement, drainage layers, collection system, anchor trenches, and other pertinent site features.

h. A statement from the geomembrane inspector giving an opinion the geomembrane integrity at the end of geomembrane placement.

Spray Irrigation Field

40. Koppers Co., Inc. shall implement the closure plan for its spray irrigation field as discussed in the closure plan report. The results of that closure and all actions taken shall be incorporated into the construction documentation report covering covering closure of the surface impoundments.

CONDITIONAL APPROVAL

Based on the foregoing findings of fact and conclusions of law, the Department hereby conditionally approves the closure and long-term care plan for the Koppers Co., Inc. surface impoundment. This is based on the premise that all conditions required by this approval are met.

NOTIFICATION OF APPEALS RIGHTS

If you believe that you have a right to challenge this decision, you should know that Wisconsin statutes and administrative rules establish time periods within which requests to review Department decisions must be filed.

For judicial review of a decision pursuant to sections 227.52 and 227.53, Wis. Stats., you have 30 days after the decision is mailed, or otherwise served by the Department, to file your petition with the appropriate circuit court and serve the petition on the Department. Such a petition for judicial review shall name the Department of Natural Resources as the respondent.

This notice is provided pursuant to section 227.48(2), Wis. Stats.

Koppers Co., Inc.
Pittsburg, PA 15219

SUBJECT: Hazardous Waste Closure and and Long-Term Care Plan
Koppers Co., Inc. - Surface Impoundment
Condition Clarification
EPA I.D. WID 006179493

Dear Mr. Batchelder:

This letter is to clarify the intent of one of the conditions listed in the closure and long-term care plan approval issued by the Wisconsin Department of Natural Resources on October 1, 1987. Condition 17 of that letter included several typographical mistakes which were not corrected prior to the approval being issued. As a result, the Department is at this time clarifying that condition. The condition is meant to read as follows:

"17. Once site background has been established, samples shall be collected quarterly from each upgradient and each downgradient well and analyzed for the parameters listed in Condition 13. This data shall then be statistically compared to the background data to determine whether any statistically significant differences exist. The data and test calculations shall be submitted to the Department quarterly. As proposed by Koppers, the Cochran's approximation to the Behrens-Fisher student's T-test shall be used to perform the statistical comparisons following the procedures described in s. NR 181.49(6)(h)1.a., Wis. Adm. Code. Upon written request from Kopper's Co., the Department will consider approving a statistical test which requires one lab analysis per quarter per well rather than four analyses as required by Cochran's approximation to the Behrens-Fisher student's T-test."

Please review this condition carefully and amend it to the previously issued plan approval. We regret any confusion this may have caused.

5910

If you have any questions regarding this condition, please contact either Ed Lynch at (608) 266-3084 or Jim Brownell at (608) 267-3534.

Sincerely,

Barbara J. Zellmer, Unit Leader

Re: Construction Documentation Report
Surface Imoundments
Koppers Industries, Inc.
Superior, Wisconsin

Dear Mr. Lynch:

Enclosed please find five (5) copies of the Construction Documentation Report describing the closure of the surface impoundment system for the above-referenced facility. The report also contains the engineer's and operator's certification of closure. Please note that information to be included as Appendix G is not available at this time and will be forwarded to you upon receipt for inclusion.

BM&S is anxious in obtaining agency approval of this closure report in an expeditious manner so as to reduce our required financial assurance currently demonstrated through a letter of credit.

Please call if you have any questions.

Sincerely,

Matthew C. Plautz, P.E.
Program Manager-Environmental Services

1.0 INTRODUCTION

This Construction Documentation Report, titled "Surface Impoundment Closure - Koppers Industries, Inc., Superior, Wisconsin" has been prepared to conform to the requirements contained in the conditional approval by the Wisconsin Department of Natural Resources (WDNR) on October 1, 1987 of "Closure and Post-Closure Plan for the Koppers Company, Inc. Hazardous Waste Management Facility, Superior, Wisconsin - Surface Impoundments - EPA I.D. No. WID006179493 ("the Plan") dated August 27, 1987. The location of the Koppers Industries site is shown on Figure 1-1. Figure 1-2 shows the location of the surface impoundments on the plant property. "The Plan" was prepared in accordance with the requirements of the Wisconsin Administrative Code, Chapter 181.

This report will provide information required by conditions 24 and 33 through 39 in the above noted Conditional Approval and includes:

- Listing of project personnel
- Documentation of sludge removal from the surface impoundments
- Plans and cross-sections to document the extent of excavation and fill and to document the certified area
- Construction narrative explaining how the project was accomplished
- Description of well decommissioning
- Technical description of cap construction
- Color print photo documentation
- Letter of Certification under the seal of a registered professional engineer

- Appendices containing daily field reports, inspection reports, materials and services suppliers lists, and field and laboratory test results; the Appendices have been bound separately as Volume II.

2.0 PROJECT PERSONNEL

The principal organizations and individuals involved in the project were as follows:

Owner:

Koppers Industries, Inc.
Superior, WI
John Heller - Plant Manager
David Shaw - Plant Manager

Project/Construction Manager:

Keystone Environmental Resources, Inc.
Monroeville, PA
Diane Smith - Hydrogeologist
Bill Ice - Project Manager
Walt Kuenzi - Certifying Engineer
James Thomas - Health & Safety Manager
Richard Van Tassel - Geotechnical Engineer

Geotechnical Testing, Observations, & Consulting:

STS Consultants, Ltd.
Superior, WI
Fred TePaske - Engineering Technician

Contractor:

J. R. Jensen & Son, Inc.
Superior, WI
Keith Jensen - President

Liner Subcontractor:

Geo-Synthetics, Inc. (GSI)
Pewauke, WI
Eric Snow - Field Supt.

Surveyor:

Seaway Engineering Co.
Duluth, MN
John Hinzmann, Jr. - PE&LS

Throughout the project, representatives from the above organizations met as needed; to plan the work activities, to discuss the status of the work, and to review the progress of construction activities.

David Shaw, the former Koppers Plant Manager, served as Construction Coordinator and Resident Inspector, with Fred TePaske of STS Consultants on board to follow geotechnical aspects and observe construction practices. Both prepared daily field reports which were distributed to serve as a communication tool and to support subsequent documentation.

3.0 SUMMARY OF IMPOUNDMENT CLOSURE ACTIVITIES

It must be noted herein that certain predecessor events required as part of the "Closure" had already occurred prior to Jensen's arrival on site. As early as April 1988, dewatering operations had commenced with K-001 sludge and bottom sediment removal completed by August 3, 1988. This phase of the work was performed directly between the owner and another contractor with no participation by Keystone Environmental Resources, Inc. However, since this work is considered an integral part of the closure, its documentation is included in this report. (See Attachment 1).

Also, during August 1988, a Keystone hydrogeologist obtained soil samples and supervised the decommissioning of eleven wells around the impoundments. These activities are documented in a subsequent section of this report.

Keystone prepared bid packages, secured proposals, and assisted the owner in awarding construction contracts during August 1988. The scope of work was based strictly on the Closure Plan dated August 27, 1987, and DNR's "conditional approval letter" dated October 1, 1987.

Early in September 1988, Keystone's Health and Safety Department conducted a Hazardous Workers Operation Training Program at Superior, WI for all personnel to be involved in the work.

Concurrent with the above, Keystone's engineers held a series of preconstruction meetings with J.R. Jensen & Sons, STS Consultants, and Seaway Engineering to review details of the work to be performed and to prepare and agree on a schedule for completing each task. (See Table 3-1.) Expected accountability and administrative procedures to be followed were also covered at these meetings.

Site mobilization and actual field work by Jensen began on September 12, 1988. During the first two days, embedded pipes were removed and the dike separating the two impoundments was partially removed to permit easy access between the two areas. The areas were proof-rolled and reworking of the fill was required at several soft spots to achieve the desired compact condition prior to placement of fill material.

Date	Revision	Checked	Approved

After Seaway's baseline survey, unclassified fill was hauled in, dumped, layered with a D-6 dozer, and compacted with a vibratory sheepsfoot to grade per plan. This unit of work started September 15, but was not completed until October 2, 1988, due to excessive periods of precipitation.

Placement of the 24-inch layer of clay barrier soil, handled in a similar fashion, began October 4, 1988, and was completed four days later. Sand was used with a road grader to smooth out rough spots prior to placing the liner.

GSI mobilized to the site on October 10, 1988. On the following day (Oct. 11), GSI placed and seamed 16 panels of HDPE liner. The balance of the synthetic membrane was placed and seamed. All seams were leak tested and repaired as required the following two days. Concurrently, Jensen assisted by excavating and backfilling the anchor trenches.

Jensen placed the first layer of geotextile fabric on October 14, 1988, followed by placement of underdrain pipes and 12-inch drainage layer. A second layer of geotextile was placed on top of the drainage material.

Unclassified fill hauling, placement, and compaction started on October 18, 1988 for the 30-inch depth of soil fill called for on top of the drainage layer. Due to periods of rainfall, this unit of work was not completed until October 28.

Topsoil placement and rough grading of this material was completed on November 4, 1988. Remaining work (final drainage improvement, seeding, and mulching) was rescheduled for late spring 1989 due to rapidly approaching winter weather.

Jensen re-mobilized during June 1989 with the placement of an additional 438 cubic yards of top soil and completion of rough grading.

Seaway Engineering established final grades which were approved by Keystone in August 1989. Jensen completed final touch-up work on August 25 prior to arrival of their landscape sub-contractor, Kerrick Sod Co.

All activities related to vegetation work (lime, fertilizer, seed and mulch) by Kerrick were completed on August 29, 1989. Ample subsequent rainfall resulted in a successful level of germination over the entire surface area as observed by Keystone on October 4, 1989.

4.0 CLOSURE ACTIVITIES

4.1 Health and Safety

At the time of bid solicitation, a site-specific Health and Safety Plan was prepared and included as part of the bid document to insure that contractors would be alerted to the project health and safety requirements. Additionally, after the contract was awarded, a special 24-hour health and safety training program was conducted by Keystone's Health and Safety Department for contractor's personnel. This presentation was amplified by covering the content of the Health and Safety Plan including:

Personnel Decontamination Procedures.

Air Monitoring.

Personnel Protective Equipment.

Emergency Procedures (First Aid, Fire, Etc.).

Material Safety Data Sheets.

Levels of Protection.

During removal of abandoned pipes and a manhole, and also during preparation of the subgrade (modified Level C), Keystone provided an on-site health and safety representative to conduct organic vapor monitoring utilizing the HNu photoionization analyzer. Observations indicated that respirators were not required.

During the balance of the project (Level D), the owner's plant manager served as the on-site health and safety officer. No injuries or problems were encountered.

4.2 Preconstruction Meetings

Prior to project mobilization, Keystone representatives met with participating organizations/contractors to insure that the work would be executed efficiently and in strict accordance with the plans and specifications. Three meetings were held to:

a. Identify the participants and responsibilities of each member of the team.

b. Review the scope of work (owner's responsibility - contractor's responsibility, etc.)

c. Select locations for imported materials.

d. Establish construction schedule.

e. Promulgate reporting requirements.

f. Discuss potential suppliers of commercial materials.

g. Review Health and Safety Plans.

h. Clarify inspection and testing requirements.

i. Agree on frequency of survey to verify grades.

Memos from the three preconstruction meetings are contained in Appendix C.

4.3 Groundwater Monitoring

4.3.1 Well Decommissioning

During the week of August 1, 1988, 11 wells (L-1S, L-2S, L-3S, L-3M, L-4S, L-4M, L-4D, L-5S, L-5M, L-5DR, and L-17) were decommissioned so that they would not interfere with the capping of the surface impoundments. A physical data summary of

these wells is presented in Table 4-1. The locations of these 11 abandoned wells are shown in Figure 4-1.

The decommissioning procedure involved removing the steel protective casings and cutting the PVC riser pipe off at ground level. In several cases, the PVC well pipe was entirely removed from the ground because it was lodged inside the steel protective casing. Any well pipe remaining below the surface was filled with cement-bentonite grout which was allowed to cure for 24 hours. All of the S-series wells were then drilled out with 4 1/4 inch ID hollow stem augers to their total depths. All of the M-series and D-series wells were drilled out with 4 1/4 inch ID hollow stem augers to a depth of ten feet. Finally, the borehole was filled with cement-bentonite grout.

4.3.2 Monument Installation

Three surveying monuments were also installed per the specifications of Seaway Engineering Company of Duluth, Minnesota, the surveying contractors. The approximate locations of these three monuments are shown on Figure 4-1; they were located near the impoundments for use in the construction and surveying of the impoundment cap.

The monuments were installed by drilling an eight foot deep boring at each location and inserting a six inch diameter cardboard tube into each boring. At the location of Mon-1, the tube was successfully inserted to a depth of seven feet and one-half inch. At Mon-2, the tube was inserted to a depth of six feet and at Mon-3 it was inserted to a depth of eight feet. A concrete company was then called to cement the surveyors monuments (aluminum caps over rebar) in place within each cardboard tube. Mon-3 was subsequently destroyed by the contractor during the construction of the cap for the impoundments.

4.3.3 Well Installation

The locations of all existing and decommissioned monitoring wells in the vicinity of the surface impoundments at the Superior site are shown on Figure 4-1.

In April 1988, a Keystone hydrogeologist supervised the drilling and logging of boring R-5D. Originally, this location was to be the site of a monitoring well to be screened

within the sand unit found within 35 to 50 feet below the ground surface at the Superior site. However, during drilling no sand unit was encountered at the chosen location after split-spoon sampling had been performed to a depth of 59 feet. Keystone obtained permission from WDNR to grout the boring. Thus, no well was installed at location R-5D; the boring log for boring R-5D is located in Appendix A.

In November 1988, Keystone subcontracted Wisconsin Test Drilling, Inc. of Schofield, Wisconsin to supervise the installation of three wells, MW-1S, MW-4S and MW-4D, in the vicinity of the impoundments. Wells MW-1S and MW-4S were screened within the clay unit, while well MW-4D was screened within the sand. The locations of these newly installed wells are shown on Figure 4-1. The boring logs for these wells are located in Appendix A. Table 4-2 presents a physical data summary for these three wells. A fourth well, MW-2S was to be installed within the clay unit, however, marshy ground conditions precluded installation of this well in November, 1988. This well is scheduled to be installed on November 6-7, 1989.

4.4 Impoundment Subgrade

4.4.1 Evaluation

Closure of the two surface impoundments at the Superior site was initiated during July 1988. The removal of all impoundment sludge and visibly contaminated soils was completed on August 2, 1988, allowing the subgrade sampling activities to take place after this time. Because the impoundment system is being closed as a landfill, and the sludges and visibly contaminated soil had been removed, the subgrade sampling program was designed to characterize subgrade soil quality after excavation, and to gather data to determine if any potential effect on human health or the environment could exist after closure. Background soil samples were also collected to provide information on soil quality unaffected by the surface impoundment.

Subgrade sampling was conducted at 12 locations which had previously been approved by the Wisconsin Department of Natural Resources (WDNR), as shown in Figure 4-2. Four borings were located in the bottom of each of the two impoundments (LB-1 through LB-8). The remaining four borings (LB-9 through LB-12) were located on the berms of the impoundments. Two background borings (BB-

1 and BB-2) were located in the approximate locations shown in Figure 4-3. Wisconsin Test Drilling, Inc. was subcontracted for the soil boring/sampling. An engineering type ATV drill rig (CME 45) was used to perform these borings.

The borings located in the bottom of the two impoundments (LB-1 through LB-8) were sampled by hydraulically pushing a Shelby Tube sampler or three-inch split-spoon from the ground surface to a 1.0 foot depth interval, and then hydraulically pushing a two inch split spoon from 1.0 to 3.0 feet. The borings located on the berm (LB-9 through LB-12) were advanced using hollow stem augers. Split-spoons were hydraulically pushed 1.5 to 2.0 feet; samples were collected continuously to the termination of the boring. The two background borings (BB-1 and BB-2) were advanced by hydraulically pushing a three-inch split-spoon continuously to the termination of the boring. Soil samples collected in the field were trimmed and logged according the Burmeister soil classification system, placed in clean glass jars, and stored at the Superior plant. Any visible or odorous indication of the presence of chemical constituents in these samples was noted. When split-spoons were used, they were decontaminated between samples with soapy water, followed by a clean water rinse and rinses with acetone and distilled water. After completion of each boring located in the bottom of the surface impoundments, the small holes were backfilled and the top six inches were sealed with bentonite. Borings located in the berms of the impoundments were grouted upon completion, and the background borings were entirely filled with bentonite. Boring logs for all impoundment and background borings are contained in Appendix A. Descriptions of visible or odorous indications of the constituents of concern are located in Table 4-3.

The uppermost 35 to 50 feet of unconsolidated material which lies beneath the ground surface at the site consists of a Quaternary red-brown clay deposit. This deposit has been interpreted to represent lake bottom sediments deposited beneath a floating year-round ice cover, thus explaining the lack of varves or laminations within this clay. Gray silt pockets or streaks observed in the past and also evident in the impoundment borings may be consistent with the lake bottom interpretation for these sediments. The bottom of this clay has not been penetrated by any borings at the site. At depths ranging from 35 to 50 feet below ground surface, a semi-continuous sand deposit characteristic of a meltwater stream deposit is present. Local information indicates that bedrock is present at 170 to 210 feet below the surface at the site.

OBSERVATIONS OF VISIBLE/ODOROUS INDICATIONS OF CHEMICAL CONSTITUENT PRESENCE

SUPERIOR, WISCONSIN
KOPPERS INDUSTRIES, INC.

Boring	Observation
LB-1	Creosote odor at 0.0-1.0 ft.
LB-2	Creosote odor at 0.0-1.0 ft.
LB-3	Creosote odor at 0.0-1.0 ft.
LB-4	No odor, no visible indications
LB-5	Creosote odor at 0.0-1.0 ft.
LB-6	Creosote odor at 0.0-1.0 ft., Slight creosote odor at 1.0-2.0 ft., Very slight creosote odor at 2.0-3.0 ft.
LB-7	Very slight creosote odor at 0.0-1.0 ft.
LB-8	Creosote odor at 0.0-1.0 ft.
LB-9	Slight creosote odor at 3.5-5.5 ft., Strong creosote odor and creosote patches at 5.5-9.5 ft., Slight creosote odor at 9.5-10.5 ft., Very slight creosote odor at 10.5-11.5 ft.
LB-10	No odor, no visible indications
LB-11	No odor, no visible indications
LB-12	No odor, no visible indications
BB-1	No odor, no visible indications
BB-2	No odor, no visible indications

As seen in the boring logs, the red-brown clay to clay and silt is the predominant unit present at all locations. A trace of light gray silt pockets/streaks was observed at all locations and traces of organics present as plant material or decomposed organics were present at most locations. Layers of discontinuous fine sand up to one inch thick were observed in boring LB-12 only. At the background boring locations, two to three feet of fill was present just above the red-brown clay unit.

Selected subgrade and soil samples were submitted for laboratory analysis. For LB-1 through LB-8, located in the bottom of the impoundments, the 0.0 to 1.0 foot sample was selected for analysis. Using an average surface elevation for these eight borings, and knowing the elevation of each of the borings located on the berms of the impoundments, a sample which would be located at the same elevation as the 0.0 to 1.0 foot sample in the impoundment bottoms was collected for analysis in each of the four borings in the berms. Thus, in LB-9 and LB-12, the 8.5 to 9.5 foot interval was analyzed, in boring LB-10 the 9.0 to 10.0 foot interval was analyzed and in LB-11 the 7.5 to 8.5 foot interval was selected for analysis. The depth interval for the samples to be analyzed in the background borings was selected in a similar matter. Thus, for both BB-1 and BB-2, the 6.5 to 7.5 foot depth interval was submitted for analysis. The termination depth of the borings located on the impoundment berms and the background borings was two feet below the depth of the sample selected for laboratory analysis.

All samples to be submitted for laboratory analysis were placed in iced coolers and shipped overnight to Keystone's Analytical Laboratory in Monroeville, Pennsylvania. All of the collected samples were analyzed for polynuclear aromatic hydrocarbons, phenolics, oil and grease, arsenic, chromium, copper, lead and zinc. Analytical results for these samples are contained in Appendix B.

Table 4-4 lists the total polynuclear aromatic compounds and total phenolics levels found in each sample. Of the total phenolics listed, phenol was the constituent most commonly found; it was present in eight samples. Pentachlorophenol and 4-nitrophenol were each present in five samples and 2,4-dimethylphenol was found in four samples. Of the polynuclear aromatic compounds, phenanthrene, naphthalene and fluoranthene were the constituents most commonly found at elevated

TABLE 4-4

KOPPERS INDUSTRIES, INC.

Sample	Total Polynuclear Aromatic Compounds (ug/Kg)	Total Phenolics (ug/Kg)
LB-1, 0.0-1.0 ft.	48389	2373
LB-2, 0.0-1.0 ft.	220.2	ND
LB-3, 0.0-1.0 ft.	82613	751
LB-4, 0.0-1.0 ft.	745.2	1162
LB-5, 0.0-1.0 ft.	1857	88.0
LB-6, 0.0-1.0 ft.	15113	844
LB-7, 0.0-1.0 ft.	903.6	178
LB-8, 0.0-1.0 ft.	1168.17	420
LB-9, 8.5-9.5 ft.	171590	1529
LB-10, 9.0-10.0 ft.	1617.3	898
LB-11, 7.5-8.5 ft.	94.3	71.2
LB-12, 8.5-9.5 ft.	ND	185
BB-1, 6.5-7.5 ft.	ND	ND
BB-2, 6.5-7.5 ft.	22.97	872

NOTE:

(1) ND indicates not detected.

concentrations as compared to the other polynuclear aromatic compound constituents.

In addition, oil and grease was detected in four borings. These concentrations were 176 mg/Kg in LB-3, 59.4 mg/Kg in LB-4, 73.6 mg/Kg in LB-6 and 215 mg/Kg in LB-9. Boring LB-9 showed the highest levels of chemical constituents of concern and also was the only boring at which visible creosote was present. It is believed that the discontinuous creosote patches which were observed in the LB-9 sample were present in the soil before the construction of the impoundments and were not the result of migration through the berm, but rather the results of previous operations.

The two borings located in the southern half of the southern-most impoundment, LB-1 and LB-3, contain relatively high levels of total polynuclear aromatic compounds and total phenolics. Considering the other borings, no obvious spatial patterns are apparent. LB-6 had relatively high levels of total polynuclear aromatic compounds and total phenolics. One background boring sample, BB-2, contained a total phenolic level of 872 ug/Kg, comprised entirely of phenol. The presence of phenol in the background sample may indicate that the phenol levels in the impoundment samples may not be present entirely as a result of the treatment of wastewater in the impoundments. Phenols and phenolic compounds occur naturally in all soils; they are generated in part from decomposition of vegetation.

The levels of total polynuclear aromatic compounds are most likely higher than the total phenolics levels because of their relative sorption/solubility differences. Polynuclear aromatic hydrocarbons are strongly adsorbed onto soils and phenolics are generally more water soluble, although the individual phenolics constituents vary widely in solubility.

Each soil sample was also analyzed for total arsenic, total chromium, total copper, total lead, and total zinc. Considering first total arsenic, several samples (including LB-9 which showed the highest level of total polynuclear aromatic compounds) had concentrations below the detection limits for arsenic. The highest level of arsenic, 3150 ug/Kg, was present in sample LB-11. One background sample, BB-1, contained 1080 ug/Kg arsenic. Arsenic is found naturally in soils; the mean value of arsenic in dry soils is reported to be 6 ppm which is equivalent to 6000 ug/Kg.

Total chromium was present in all soil samples tested; both background soil samples had levels very similar to the subgrade samples. Levels of chromium did not vary significantly across the site; the range of values was 30,000 ug/Kg in LB-5 to 45,600 ug/Kg in LB-9.

Total copper also was present in every tested soil sample. With the exception of sample LB-1, which had a total copper level of 84,600 ug/Kg, concentrations were similar. Excluding LB-1, total copper levels ranged from 40,100 ug/Kg in BB-2 to 53,900 ug/Kg in LB-8. Again, spatial trends did not appear significant.

Total lead levels showed the most variation of all metals tested. Background sample BB-1 had the highest lead concentration; 76,680 ug/L. The only other three samples with this order of magnitude lead level were LB-1, LB-3 and LB-9, which had the highest total polynuclear aromatic compound concentrations. Other soil samples had values ranging from 6650 ug/L in LB-4 to 9140 ug/L in LB-8.

Total zinc was found at similar levels in all samples and did not show significant spatial variation. Values ranged from 49,200 ug/L in LB-10 to 65,400 ug/L in LB-1.

Past slug testing performed in wells completed in the clay at the Superior site revealed that the hydraulic conductivity of the clay averaged 1.6×10^{-5} cm/second. In contrast, the sand layer present at the site between 35 and 50 feet below ground surface has a hydraulic conductivity in the 10^{-3} cm/second range. This range is typical for a sand deposit and is at least two orders of magnitude greater than the hydraulic conductivity calculated for the clay. Thus, the sand layer is considered the uppermost aquifer at the Superior site, while the clay acts as an aquitard.

In summary, although there is evidence of elevated levels of chemical constituents of concern in several subgrade samples, this condition is expected to remain localized due to the low permeability of the clay. The detection of creosote odors rapidly tapered off with depth, even though creosote has a low odor threshold. Groundwater samples from the abandoned 11 wells had not been degraded in quality, with the exception of well L-5S which was located in the vicinity of a previously abandoned surface impoundment. Because of the high permeability contrast between the clay unit and the underlying sand unit, the primary direction of groundwater migration within the clay and the direction of mobility of elevated

chemical constituents within soils will be vertically downward. Any appreciable lateral groundwater migration at the Superior site will occur through the sand unit, which is currently being monitored.

4.4.2 Preparation for Construction

To prepare for the construction, several activities were performed and included the evaluation of clay and drainage material borrow sources, proof rolling the subgrade, and the removal of buried pipes at the impoundment dike. These activities are described in this section.

Clay Borrow Source

The project team members inspected the lands from which the contractor proposed to obtain clay soil required to backfill the surface impoundments and construct the clay closure cap. Two samples of clay soil were obtained from the area of the proposed borrow area. A visual inspection of the borrow source and soil indicated that it was a highly plastic clay and there appeared to be a sufficient quantity available to fulfill project requirements.

Soils laboratory tests were performed on the samples to obtain geotechnical parameters. Grain size and Atterberg limit tests were performed to obtain quantitative data to describe the soils. Moisture density tests were performed to determine the degree of compaction that could be achieved during construction. In addition, Permeability tests were performed to confirm the coefficient of permeability was low enough for a closure cap. The results of these tests are presented in Table 4-5.

The results of these tests are presented in the report where the specific soil layer is discussed. In summary, the borrow source can be described as a red-brown clay, trace of sand, highly plastic, and can be compacted to a dry density in excess of 90 pounds per cubic foot. The results of the soils tests, performed by the STS on a subcontract basis, are presented in Appendix E.

NOTES:

(1) - Source code: B = borrow, N = North Impoundment, S = South Impoundment.
(2) - Permeability testing: Clay - Falling Head, Granular - Constant Head; Borrow sample - remolded, Field sample - undisturbed.
(3) - Soil type determined by Unified Soil Classification System (USCS).
(4) - Borrow sample A3-B1 was from another borrow source not used for construction.
(5) - Cu = Uniformity coefficient, Cc = Coefficient of curvature.

Drainage Layer Materials

The initial borrow sources proposed by the Contractor for drainage material, the "Patterson Pit", was inspected and evaluated. The banks of the pit showed signs of having high percentages of silt and widely varying distributions of particle sizes. A soil sample had been previously obtained by the contractor so no sample was taken. It was judged that this material would require screening to remove the fine materials and it was not recommended as a source for the drainage layer materials. The contractor was instructed to find another source of material suitable for the drainage layer.

The Contractor subsequently found a source of suitable sand and gravel that fulfilled the requirements for drainage layer materials. Drainage layer materials were obtained from the "Allen pit", located on Highway B, in Douglas County.

Three samples of material from this borrow source were obtained and soils laboratory tests performed. Three sieve analyses, two Standard Proctors, and two permeability tests were performed on the Allen pit materials. The test results are presented in Table 4-5 and are summarized as follows:

Grain Size	silt or clay	0%
	fine to coarse sand	85%
	fine to coarse gravel	15%
Uniformity Coef.		2.2 to 2.5
Standard Proctor		100 to 104 PCF; 7% Wc
Permeability (cm/sec)		1.5 to 3.9 x 10^{-2}

The amended closure plan required less than 5% passing the number 200 sieve, a uniformity coefficient less than 6, and a permeability greater than 1 x 10^{-3} centimeters per second (cm/sec). Based upon these results, the materials fulfilled the requirements for drainage materials as prescribed in the closure plan and were approved for the closure construction.

Site Preparation and Proof-rolling

To ready the impoundments to receive fill materials, some preparatory work was required to remove rainfall that had collected and to dry out the in situ soils. The plant personnel pumped out the ponded rainfall and discharged it onto the spray evaporation field. Air drying and discing of the wet soils was performed by the contractor to improve the condition of the soils. These efforts improved the condition of the soils so that the proof-rolling activities could be accomplished. The proof-rolling of the subgrade is shown on Photograph No. 1 (Photographs are presented in Attachment 2).

Removal of Buried Pipes and Center Dike

Some buried pipes in the center dike area and perimeter walls of the impoundments were uncovered and removed as shown on Photograph No. 2. In addition, higher portions of the center dike were cut down to permit the backfilling of the impoundments and to construct the full thickness of the closure cap. Photograph No. 3 shows the excavation of the higher portions of the center dike. The materials excavated were placed and compacted on the bottom of the impoundments to prepare the impoundments to receive imported backfill. The pipes were cleaned and removed from the impoundments.

These activities were accomplished to prepare the impoundments for the subsequent backfilling operations and closure cap construction.

4.5 Unclassified Soil Fill

The clay soil from the approved borrow source was placed, conditioned, and compacted in the soil fill zone of the cap construction. The compaction of the first layer of unclassified soil fill is illustrated by Photograph No. 4. The clay soils were wetter than the optimum moisture content and required drying prior to the compaction effort. To obtain the proper moisture condition, the soil was spread over the work area, disced with farm equipment to break down clods and increase the soil surface area. The soils were disced repeatedly until the soil was dryed,and clods broken down enough to enable compaction.

The soils were spread over the fill area by a dozer and compacted with a self-propelled compactor as shown by Photograph No. 5. The conditioned soils were compacted in lifts of about 8 inches thickness using a self-propelled compactor. The compactor had a "sheeps-foot" type drum and an oscillator to apply dynamic forces to the soils. Inspection of the soil conditioning and compaction work was performed by STS's inspector who was experienced in working with the local soils to construct engineered embankments. A compacted surface of the unclassified soil fill zone is shown on Photograph No. 6. The extent of this embankment zone is illustrated on cross-sections of the "as-built" drawings, which are contained in Attachment 3.

During these operations, field nuclear density testing was performed to assure the construction met the requirements of the closure plan. Thirty-five field nuclear-density tests were performed to assure the compacted soil fill met the dry density requirement of at least 95 percent for compacted clay soil. As presented in Table 4-6, all field tests showed the compacted densities fulfilled the dry density requirement and the moisture content was slightly wetter than the optimum of 24 percent.

In addition to the field density tests, samples of the compacted fill were obtained to perform geotechnical tests in a soils laboratory. Eight samples were obtained, four from each surface impoundment at various levels of the backfilling operation. These samples were tested in the soils laboratory for grain size and Atterberg limits. The results of these tests are presented in Appendix E and are summarized in Table 4-5. These results indicate the soil materials were essentially the same as the red-brown, highly plastic clay that was approved for the closure cap construction.

4.6 Clay Barrier Soil

The clay barrier soil was constructed of soils from the approved borrow for clay soil fill. The red-brown clay soil was tested and approved for use as the low permeability fill to form the barrier clay zone of the closure cap. The soil type, plasticity, maximum density and permeability test results fulfilled project requirements as discussed under Section 4.4.2, above.

Since the soil fill and the barrier clay soil are the same material, and the placement, conditioning, and compaction operations were the same, there is no potential for the migration of fines from one soil zone to the other. Accordingly, there was no need

TABLE 4-6

SUMMARY OF FIELD NUCLEAR GAGE TEST RESULTS

Drainage Sand Layer	3	95.5 to 96.4	95 to 96	95.8	95.3	6.2
Cover Soil	7	90.8 to 92.6	96 to 97	91.7	96.7	28.0
Topsoil	5	68.9 to 70.3	90 to 91	69.7	90.8	35.3

for the geotextile filter fabric between these two layers and it was omitted with the concurrence of Wisconsin Department of Natural Resources.

Along with the field density tests, additional soils laboratory tests were performed to assure the soils from the borrow source was suitable for barrier clay soil. Two samples were obtained and grain size, Atterberg limits, Standard Proctors, and permeability tests were performed to document that the soil was appropriate for the intended construction. The results of these tests are presented in Appendix E for samples A2-B1 and A2-B2. These results are summarized as follows:

Test	Sample A2-B1	Sample A2-B2
Standard Proctor	92 PCF 29% Wc	92 PCF 27% Wc
Grain Size	5% Sand 95% Fines	5% Sand 95% Fines
Atterberg Limits	91% LL 26% PL 65% PI	79% LL 24% PL 55% PI
Permeability (cm/sec)	2.8×10^{-8}	2.6×10^{-9}

The above data indicates that this source of clay barrier soil fulfills the regulatory requirements for a permeability less than 1×10^{-7} cm/sec.

The clay barrier soil was placed, conditioned and compacted in lifts of about 8 inches thickness and the operations are shown by Photograph No. 7. The construction methods were the same as for the unclassified soil fill zone. Construction inspection and quality assurance testing was performed by the field representative of the certifying engineer. The results of the field nuclear density tests for each compacted layer are presented in Appendix E and summarized in Table 4-6. The fifteen field density tests indicate that all dry densities exceeded the requirement of 95 percent of maximum dry density.

In addition, samples of the compacted fill were obtained and tested in the soils laboratory to confirm the soils were the same as approved for construction and that in-place permeabilities of the constructed fill were less than the regulatory requirement for clay barrier soil. These test results are summarized in Table 4-5 and indicate that the permeability of the constructed fill was less than the required 1×10^{-7} cm/sec.

This soil zone was constructed in three lifts of 8 inches each to yield the required 2 feet thickness of clay barrier soil. The thickness and extent of the of the barrier clay soil is shown on the "as-built" plan and cross-section drawings. The top layer was brought to the required elevations and graded to provide the 5 percent slope designated in the approved closure plan. The surface of the barrier clay soil zone is illustrated by photograph No. 8.

4.7 Synthetic Membrane

Subsequent to the approval of the barrier clay soil construction, the "impermeable" membrane was installed. In preparation for the liner, an anchor trench was excavated around the perimeter of the impoundment as shown on the detail of the approved design. This trench was excavated two feet higher and offset six feet along the south, west and north edges of the clay barrier soil. The anchor trench excavation along the western edge is shown on Photograph No. 9. Along the eastern perimeter the trench was offset nine feet and about one foot higher than the barrier soil layer as shown on Photograph No. 10. The extent of the impermeable membrane installation is shown on the "as-built" plan and cross-section drawings.

In addition to the anchor trench construction, a leveling course of sand was spread over the clay soil layer to fill small depressions in the clay soil surface. The placement of this sand cushion is shown on Photograph No. 11 and the cushion is also evident in Photographs No. 9 and 10, cited above. This thin layer was recommended by the membrane installer (Geo-Synthetics, Inc.) to provide uniform bedding for the liner. This layer was placed to a thickness of from 0 to 2 inches, the thicker zones at the edges near the anchor trench.

Geo-Synthetics rolled out the 40 mil thickness of HDPE liner material to cover the clay barrier soil and to extend down into the anchor trench. Photograph No. 12

shows the liner in place along the southern edge of the impoundment. The liner material panels were spread out from the southern edge, progressing to the north with about 4 inch overlaps for seaming purposes. Sand filled bags were placed on the liner to prevent it from being moved and/or overturned by the wind. Photograph No. 13 shows the liner in place on the sand cushion and lying in the anchor trench.

The northern edge of the installed liner is illustrated by Photograph No. 14. A view of the complete liner installation is shown on Photograph No. 15, looking from the south in a northerly direction. The rolls of geotextile material are shown distributed on the geomembrane for installation.

After a sufficient number of panels were laid out, the panels were joined using the seaming tool as shown by Photograph No. 16. The seaming tool was a self propelled, hot shoe tool manufactured by National Seal Company, the membrane manufacturer. The seaming tool made two simultaneous parallel fusion welded seams with an air channel between the welds. This air channel was used to pressure test the fusion welds in the quality assurance testing of the field seams. Seaming was only done when air temperatures were above $40^{o}F$ as required by the closure plan.

After the entire membrane was installed, seamed and tested, areas where the air channel leaked during the pressure test were located and patched using the extrusion welding technique. In addition, test strips of the field seams were cut out and sent to the laboratories for QA/QC testing of the field seams. Replacement patches were fixed to the liner using the extrusion welding technique. An extrusion welded patch is shown by Photograph No. 17.

The test strips were tested by the installer and also by STS to determine construction quality. The tests results of the membrane and field welds performed by STS for the certifying engineer are presented in Appendix E and summarized in Table 4-7. These results indicated that the seams did not peal-off fail but that the base material failed at the grips which applied the testing forces.

In addition to the tests on the field seams, samples of the geomembrane were tested to confirm the synthetic material fulfilled the project specifications. Samples of the membrane were tested to confirm the thickness, density, strength, and moduli of elasticity.

TABLE 4-7

GEOMEMBRANE TEST RESULTS

Seam ID	Strength At Yield (lbs.) (1)	Peel Adhesion (lbs.) (1)	Peel Adhesion Test Remarks
#2	114 124	82 84	Both samples broke @ edge of bonded area.
#8	122 100	84 80	Both samples broke @ edge of bonded area.
#15	115 121	63 57	Both samples 1/8" peel, then broke @ edge of bonded area.
#19	124 117	88 79	Both samples broke @ edge of bonded area.

NOTES:

(1) - 1" wide test specimen load value.

The results of these tests are presented in Appendix E and are summarized in Table 4-7. The membrane panels, seams, and test sample locations are shown in Figure 4-4. These results indicate that the synthetic membrane materials furnished and installed at the project fulfill the specifications for the project. The extent and position of the installed impermeable membrane can be inferred from the anchor trench locations shown on the attached "as-built" section drawing.

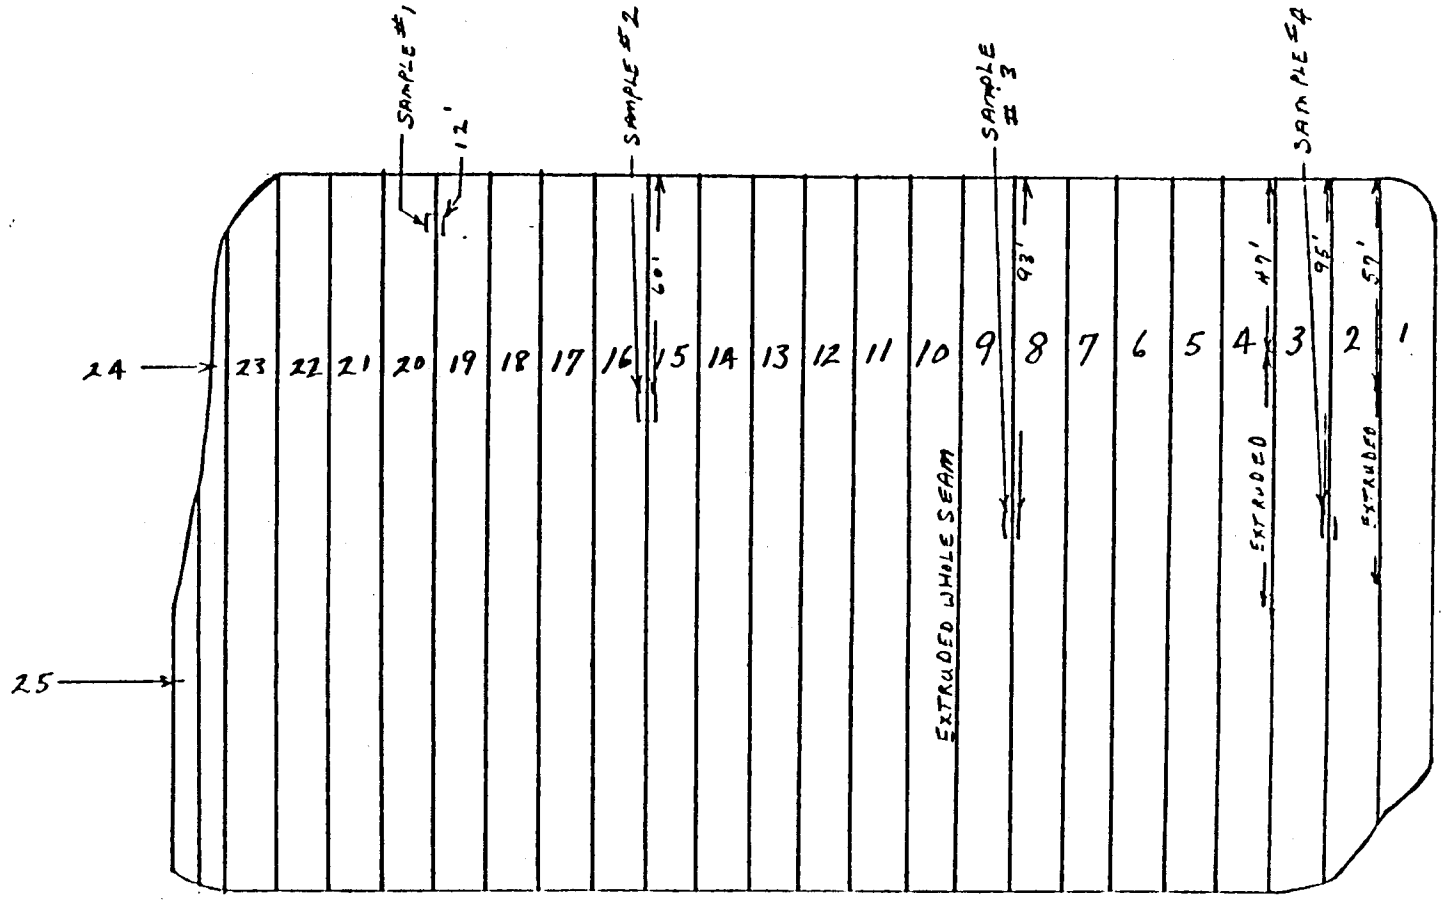
4.8 Drainage Layer Construction

After the membrane liner was installed, the drainage layer zone of the closure cap was constructed. Atop the membrane a layer of non-woven geotextile material was placed to protect the membrane from the drainage layer materials. The weight of the geotextile material was 10 ounces per square yard, spun bounded, polypropylene material manufactured by Exxon Corporation. This material exceeded the approved requirements which called for minimum of 8 ounce per square yard material.

Photograph No. 18 shows the rolls of geotextile unrolled over the geo-membrane with a lap of at least 18 inches for adjacent sheets. The geotextile was also anchored in the anchor trench which surrounded the perimeter of the closure cap. This construction was performed under the direction of the membrane installer and inspected by the field representative of the certifying engineer (STS's construction inspector).

The infiltrate collection pipe was placed on the geotextile as shown in Photograph No. 19. The schedule 40, four inch diameter polyvinyl chloride pipe was placed with the perforated holes in the downward position. The pipe was installed to slope downward from the western side of the impoundments to the discharge points located at the drainage ditch situated on the eastern side of the impoundments.

The drainage layer was then carefully placed atop the protective geotextile layer. As can be seen on Photograph No. 20, the granular material was placed and spread carefully using a light dozer. The full thickness of the sand / gravel drainage layer material was placed and spread over the geotextile. The material was spread by a small dozer in a lifting manner, insuring that the geotextile was not displaced as the granular materials were spread.



NOT TO SCALE

FIGURE 4-4

SURFACE IMPOUNDMENT

CLOSURE LINER

SUPERIOR, WI

Drawn by: EJS
November 1, 1988
Geo-Synthetics, Inc.

The placement of the drainage layer was inspected by the construction inspector and advice was provided by the geomembrane installer. The full thickness of the drainage material was assured by manual excavations to confirm that the full one foot thickness was placed. Field density tests (see Table 4-6) performed during construction indicate that the placed density of the drainage layer materials exceeded the prescribed 95 percent of maximum density.

Samples of the furnished materials were obtained and laboratory sieve tests performed to confirm the materials fulfilled project requirements. The results of the tests are presented in Appendix E and are summarized on Table 4-5. These tests indicate that the furnished materials were essentially the same as the approved materials and should perform as intended in the approved closure cap design. As shown on Table 4-5, the permeability of the drainage layer is expected to exceed the required 1×10^{-2} cm/sec.

After the granular materials were placed, the top layer of the geotextile was placed to cover the granular drainage layer materials. The 10 ounce per square yard, non-woven polypropylene filter fabric manufactured by Exxon corporation was unrolled on the surface of the granular drainage layer materials. Adjacent sheets were lapped a minimum of 18 inches as specified on the approved drawings. The sand filled bags were distributed over the surface and the cover layer of unclassified fill placed to protect the geotextile from turning over and/or displacement by the action of the wind. The placed drainage layer material and geotextile filter fabric, being covered with the unclassified cover soil, are shown on Photograph No. 21.

The anchor trench was backfilled, fixing the edges of the drainage layer and thereby completing the drainage layer construction. Periodic inspection of all operations of the drainage layer construction was performed by STS's construction inspector, as a representative of the certifying engineer. The completed drainage layer is shown on the photographs in Attachment 2 and the "as-built" plan and cross-section drawings in Attachment 3.

4.9 Unclassified Cover Soil

The clay soil from the approved borrow source was used as fill in the unclassified soil fill zone which overlies the drainage layer. This material was placed, conditioned, and compacted in the same manner as the other layers of clay soil. The first layer was placed carefully to prevent displacing or damaging the geo-textile material covering the drainage layer. The placement of the first lift of this soil zone is shown on Photograph No. 22. As can be seen, the drainage layer materials, geo-textile and soil fill are being completed in the proper sequence.

Successive lifts of the clay soil were placed until the full 30 inch thickness of this unclassified soil fill zone was constructed. The final surface of this layer of the closure cap is shown in Photograph No. 23. Also shown is the survey team taking level readings to ascertain the final grade of this zone. The surface of this layer also reflects the grade required for the surface of the closure cap.

The thickness and grade of this zone of the closure cap are illustrated on the as-built drawings. In general, the constructed thickness was about the required 30 inches and the grade of the top surface had the required 5 % slope. Some warping and deviations are evident near the edges of the cap to accommodate the irregular shape of the adjacent, unaltered soils.

The quality of the constructed fill was determined by field density tests performed on each lift of the fill. The results of these tests are presented in Appendix E and are summarized in Table 4-6. A total of 15 nuclear density tests were performed on this fill zone, 8 on the northern and 7 on the southern impoundment. The percent of optimum dry for all these tests equal or exceed the required 95 percent value.

In addition to the field density tests, samples of the soil were tested in the soils laboratory to confirm the soil met the requirements for this fill zone. The results of the tests are summarized on Table 4-5 and indicate that this soil can be characterized as a red-brown clay, having a high plasticity. The grain size tests indicate that the particle size distribution of this soil was very uniform and similar to that of the approved borrow source material for clay fill.

4.10 Topsoil Placement

Samples of soil were obtained from the source proposed by the contractor. These samples were tested in a soils laboratory to determine its suitability for use as the topsoil zone. Grain size, Atterberg limit, Standard Proctor, and fertility tests were performed on the soil samples to confirm that it would fulfill project requirements and support vegetation.

The results of these tests are presented in Appendix E and are summarized in Table 4-5. These tests indicate that the topsoil can be classified as a brown silt, trace of sand and highly plastic (MH according to the U.S.C.S.). In addition, the soil can be compacted to a maximum dry density of about 77 pounds per cubic foot at an optimum moisture content of 33 percent.

The soil fertility tests indicate the recommended amounts of soil supplements required per acre to support vegetation and to raise the soil pH. Based on the two samples tested, no lime is required for a pH of 6.0, and 2700 to 4300 pounds per acre of lime are required to raise the pH to 6.5. The amount of phosphorus required ranges between 54 and 68 pounds of P/2-O/5 per acre for grasses and legume grasses, respectively. Based upon these tests results, the topsoil was approved for project use.

The topsoil was placed on the completed unclassified fill layer as shown on Photograph No. 24. The topsoil was subsequently compacted to achieve a density of a least 90 percent of the maximum dry density. Field density tests using a nuclear densometer were performed on each lift of the topsoil. The results are presented in Appendix E and are summarized in Table 4-6 as follows, for 10 tests - all dry densities meet the 90 % requirement with the maximum value of 93 %.

In addition, QA/QC tests on two samples obtained during construction indicate that the properties of the topsoil did not change significantly during the construction. The material tested as brown silt, trace of sand with high plasticity.

The topsoil was placed, spread and compacted before the end of the 1988 construction season. Final grading of the topsoil materials, tilling of the seed bed, adding soil amendments, and seeding remain to be accomplished in the next construction season. Survey data was obtained by Seaway and confirmed that

additional topsoil would be required to complete the cap construction. The surface of the placed topsoil is shown on Photograph No. 25, depicting the end of the 1988 construction season.

Jensen remobilized during June 1989 to complete the closure construction. Jensen placed, spread, and compacted approximately 438 cubic yards of additional topsoil material. In addition, grading was completed to shape the cap to satisfy slope and grade requirements. The topsoil construction work was completed by the end of June 1989.

The completed construction was surveyed by Seaway Engineering in July 1989. Keystone developed as-built drawings based on the Seaway survey data. The final grades were approved by Keystone in August 1989

4.11 Seeding and Mulching

A professional seeding contractor (Kerrick Sod Company) was procured by Jensen and scheduled for the end of August 1989. Jensen finish graded the cap in preparation for the seeding operation during the week of August 26, 1989. The seeding contractor arrived on-site and completed the work on August 29, 1989.

The seeding operations entailed adjusting the topsoil chemistry, placing the seed mix, and finally placing a mulch ground cover. Lime and fertilizer were distributed over the topsoil using a mechanical broadcast spreader. The seed mix was prepared and placed onto the cap area by hydroseeding. The hay mulch was then blown onto the cap area and set into position by anchor discing. In anchor discing the discs are set straight with the direction of travel thereby cutting the hay and slightly pushing the hay into the soil. The application rates for each material used during the seeding operation are shown in the table below.

SEEDING OPERATION MATERIALS SUMMARY

ITEM		APPLICATION RATE
Seed Mixture	Perennial Rye	80 Lbs./Acre
	Tall Fescue	75 Lbs./Acre
	Birdsfoot Trefoil	30 Lbs./Acre
Fertilizer, 5-10-5		30 Lbs./1000 SF
Lime		2200 Lbs./Acre
Hay Mulch		2000 Lbs./Acre

During October 1989, 5 weeks after seeding, a site inspection was completed to examine the cap construction area. The grasses were growing over the entire capped area as shown on Photograph No. 26, looking northward. Photograph No. 27, looking southward, shows a closer view of the grasses. No barren or eroded areas were observed on the cap area.

4.12 Drainage Improvements

The drainage channel adjacent to the closure cap on the eastern side was enlarged to improve the drainage which serves the project area. To increase the capacity of this drainage channel, the invert of the channel was lowered and the ditch widened. A view of this construction is shown on Photograph No. 28.

The drainage channels south of the impoundments did not need improvement because their cross sections already exceeded the design cross section. Along the western side of the closure cap, a drainage channel and flow plain is present and the top of the closure cap slopes to this channel. It is proposed that this area has sufficient capacity and a new channel is not required along this side. The existing drainage capacity probably far exceeds the proposed capacity of the drainage channel in this area.

Based upon the size and location of the existing drainage channels, and the manner in which the finished cap drains to the adjacent drainage channels, it appears that the

present constructed drainage system will fulfill project requirements. Subsequent to completion of the closure cap construction and vegetation work, some channel cleaning and improvements might be required to maintain the capacity of the existing drainage system.

The improvements of the eastern drainage channel completed the construction activities for 1988 at the impoundment closure cap construction. The Winter season's snow, as shown by Photograph No. 25, caused the construction to cease for calendar year 1988.

During the cap grading and topsoil placement work of June 1989, some additional grading of the cap-drainage channel edge was completed. This work was necessary to provide a uniform drainage channel profile for surface water drainage from the cap.

During the October 1989 site inspection, the condition of the drainage channels and pipe outlets were observed. The drainage channel were free of any debris or obstructions and were nearly dry. Photograph No. 29, looking southward, shows the cap-drainage channel edge. The exposed end of the pipe outlets were clear and the flow path appeared to be unobstructed. No water was flowing from the pipes.

5.0 CERTIFICATION

See the attached forms.

PROFESSIONAL ENGINEER CERTIFICATION OF CLOSURE

I, Walter Kuenzi, P.E. being a Registered Professional Engineer in accordance with the State of Wisconsin statutes and codes related to Professional Engineers, do hereby certify to the best of my knowledge, information and belief that,

Name & Location:	Koppers Industries, Inc. Superior, Wisconsin
Facility:	Surface Impoundments (Closure)
EPA ID No.:	WID006179493

is constructed and prepared in accordance with the Facility's approved closure plan and as reflected in the documents, statements, designs and plans contained in the final report entitled: Construction Documentation Report - Surface Impoundment Closure

OPERATOR CERTIFICATION OF CLOSURE

I, Matthew C. Plautz, P.E., Program Manager
(~~Owner~~ or Operator)

Beazer Materials and Services, Inc., 436 Seventh Ave., Pittsburgh, PA 15219
(Name and Address)

hereby state and certify that, to the best of my knowledge and belief, that the

Koppers Industries, Inc. Hazardous Waste Management Facility
Superior Wisconsin, Surface Impoundments EPA I.D. No. WID006179493
(Hazardous Waste Management Unit(s))

has been closed in accordance with the facilities closure plan, and that closure was completed on the 29th day of August, 19 89 .

Mr. John Hinzmann, Jr.
Seaway Engineering Company
831 East Second Street
Duluth, Minnesota 55805

Subject: Deed Restriction for
Closed Impoundments

Dear John,

As discussed with your Keith Johnson on October 18, 1989, we are requesting a quotation for your firm to prepare a document to restrict the disturbance of lands which previously contained two impoundments. The document will be filed with the local governing body which has jurisdiction over the lands containing the Koppers Company plant south of Superior, Wisconsin.

The enclosed "Deed Notation for Closure of Surface Impoundments" describes the notice and restrictions that are to be recorded, the corners of the lands requiring the restrictions, and the necessary tie to the two permanent monuments. This enclosure presents suggestions for the deed notation. The actual document should conform to the requirements of the local authority. The document to be filed must be sealed by a registered Land Surveyor.

Request you prepare your quotation and relay the costs by telephone to me as soon as possible. Our goal is to receive a copy of the filing document on or before October 27, 1989.

If you have any questions, do not hesitate to call me for any required clarifications.

Very truly yours,

Richard L. Van Tassel

Enclosure

NOTATION TO DEED OF CLOSURE OF SURFACE IMPOUNDMENTS

KOPPERS COMPANY PLANT
HIGHWAY A, DOUGLAS COUNTY, WISCONSIN

SUGGESTED NOTATION TO THE DEED

The area within the limits of land use restrictions was formerly a waste management unit designated U.S. EPA Identification Number WID006179493. The use of the enclosed land area is restricted and the ground must not be disturbed without the approval of the Wisconsin Department of Natural Resources. Maintenance, inspections, and environmental sampling are to be performed in conformance with the approved closure plan.

This area previously contained two (2) impoundments that were part of a process waste water treatment system. The impounded waste waters, sediments, sludges, piping systems, and visibly contaminated soils have been removed in accordance with a closure plan approved by the Wisconsin Department of Natural Resources.

This plat has been filed and recorded with the "recorders office, in the Douglas County Courthouse, Superior Wisconsin" as follows:

Deed Book Volume No. _____, Page No. _____.

SUGGESTED COORDINATES OF LAND-USE RESTRICTION

Corner	East	North
1	1,480,445	546,600
2	1,480,685	546,600
3	1,480,685	546,215
4	1,480,445	546,215

TIES TO MONUMENTS

Describe the geometry to tie the restricted area to monuments situated just north and south of the closed impoundments, Monuments Nos. 1 and 2, respectively. These "ties" should also be included on the deed notice.

Prepared by R. Van Tassel (10-17-89)

7.0 POST-CLOSURE CARE

Post-closure care will be carried out in accordance with the description provided in Section IX "Post-Closure Care Requirements" of the "Closure and Post-Closure Plan for the Koppers Company, Inc. Hazardous Waste Management Facility - Superior, Wisconsin - Surface Impoundments - EPA I.D. No. WID006179493" dated August 27, 1987 and the Conditions of Approval as contained in report titled "Conditional Approval - Closure and Long-Term Care Plan - Koppers Co., Inc. - Surface Impoundment WID006179493 received October 5, 1987, and the changes set forth in the WDNR report titled "Conditional Closure and Long-Term Care Plan Approval Modification for the Koppers Co., Inc. - Surface Impoundments (WID006179493" received March 17, 1988.

ATTACHMENT 1

SLUDGE REMOVAL REPORT

INTRODUCTION

This report contains documentation of the sludge removal phase of the Superior impoundments which was performed prior to major closure activities managed by Keystone Environmental Resources, Inc. The report contains:

- A narrative description of the work performed (Prepared by Koppers plant manager Mr. David Shaw).
- A series of progress photographs.
- Copies of invoices processed between Koppers and its contractors (Rollins Environmental Services and Peoria Disposal Company).
- Copies of the Hazardous Waste Manifests covering shipments of the stabilized material.

LAGOON CLEANUP
SUPERIOR WI PLANT
September 1, 1988

NORTH LAGOON

Dewatering of the north lagoon was started in early May, 1988 and completed by June 5, 1988. This was accomplished by closing the crossover line into the south lagoon and using a low volume skimmer pump to transfer the water into the south lagoon. After the visibly clean water was removed a gear pump was used to pump the oily water back to the wastewater system through the old lagoon feed line. (Photos 1 & 2).

At completion of dewatering, the bottom had several weeks to dry. (Photos 3 & 4). Prior to starting the removal process, there was a wet oily sludge pocket that went from the southwest corner along the west side from the northwest corner and along the north bank to the northeast corner. The northeast corner had the largest volume of sludge (about 12" to 18" deep that covered an area of about 160 square feet).

Rollins Environmental Services, Inc., was given the contract to remove the waste from the site. A meeting was held on July 12, 1988 with Rich Strand and Brad Smith of Rollins, Jim Sykes of Pheifer Bros. Construction, and David Shaw of Koppers Company. Rollins subcontracted Pheifer Bros. to supply and operate the equipment used for solidification and removal of the sludge. The meeting was for the following:

1. Inspection of the site.

2. Line up supplies for cleanup.

3. To cover equipment decontamination procedures and view the area where the equipment would be decontaminated.

4. To line up admix for solidification.

5. To go over the health and safety plan.

Rollins equipment arrived on the site on Monday, July 18, 1988. They had a small cat and a backhoe. Both pieces of equipment had wide low compression tracks, both operators were experienced in waste cleanup and had the required forty hours of OSHA training prior to arrival at Superior.

Cleanup of the north lagoon was started at about 10:30 AM on Tuesday the 18th of July. Two loads of admix were dumped into the north lagoon (one in the northwest corner and one in the northeast corner). The cat operator made one shallow cut on the surface the first day and then allowed the bottom to dry before making a final cut (Photos 5 & 6).

The sludge was moved to the north and west sides of the lagoon. This allowed the dry sludge to be mixed with the wetter material and cut down on the usage of admix.

The material was then moved to the west side and then to the southwest corner of the lagoon, there it was stabilized by thoroughly mixing with the admix. The deeper northwest corner was dug down to where it appeared all visible contamination was removed (Photos 7 & 8).

Tuesday, the lagoon bottom was skimmed again with the bulldozer. At this time you could see oil in the clay cracks in the northwest corner, so more material was removed from this section. The bottom was also dressed with the bulldozer. Wednesday, more seepage was noted near the northeast corner so more material was removed (Photo 9).

On Thursday the contractors left the site at about 11:00 am. The north was clean except for removal of the accumulated material. We were not permitted to go to a landfill yet and the south lagoon still had water in it (Photo 10).

SOUTH LAGOON

We started spraying onto the sprayfield at a rate of 7,000 gallons per day on April 1, 1988. We sprayed at this rate until June 27, 1988. From June 27 to July 22, we sprayed 15,000 gallons per day. Chuck Olson, WDNR, and Greg Hill, WDNR, gave us permission to increase the discharge to 15,000 gallons per day so we would be able to meet the August 8th deadline for disposal of K001.

On July 23 we started pumping the water left in the south lagoon into the treating plant, by Monday July 25 the south lagoon was completely dewatered (Photo 11).

The sludge did not have a creosote smell, it smelled more like decayed organic material. The sludge was not oily except in the northeast corner where the crossover from the north lagoon entered the south lagoon.

The cleanup of the south lagoon began at about 9:00 am. on Monday, the 25th of July. Pat Murray, of Rollins, replaced Brad Smith as supervisor for Rollins. Admix was dumped in the northwest corner. Using the bulldozer, the admix and sludge was moved toward the east and south side of the lagoon (Photos 12 and 13).

The sludge was then moved into a narrow strip along the south side of the lagoon where it was worked toward the southwest corner of the lagoon. Admix was dumped into the southwest corner. The backhoe sat in the southwest corner and mixed the sludge as the bulldozer pushed it to him. The cleanup, except for removal of the soils, was complete by July 27, 1988 (Photos 14, 15, 16 and 17).

We began shipping waste on July 29, 1988. Trucks were loaded in this order:

July 28	3 trucks
July 29	19 trucks
July 30	14 trucks
August 1	17 trucks
August 2	9 trucks

A total of 62 truckloads of material was shipped from Superior.

The equipment was decontaminated August 3 and was removed from the site at about 2:00 pm. August 3, 1988.

16. GENERATOR'S CERTIFICATION: I hereby declare that the contents of this consignment are fully and accurately described above by proper shipping name and are classified, packed, marked, and labeled, and are in all respects in proper condition for transport by highway according to applicable international and national government regulations.
If I am a large quantity generator, I certify that I have a program in place to reduce the volume and toxicity of waste generated to the degree I have determined to be economically practicable and that I have selected the practicable method of treatment, storage, or disposal currently available to me which minimizes the present and future threat to human health and the environment; OR, if I am a small quantity generator, I have made a good faith effort to minimize my waste generation and select the best waste management method that is available to me and that I can afford.

16. GENERATOR'S CERTIFICATION: I hereby declare that the contents of this consignment are fully and accurately described above by proper shipping name and are classified, packed, marked, and labeled, and are in all respects in proper condition for transport by highway according to applicable international and national government regulations.

If I am a large quantity generator, I certify that I have a program in place to reduce the volume and toxicity of waste generated to the degree I have determined to be economically practicable and that I have selected the practicable method of treatment, storage, or disposal currently available to me which minimizes the present and future threat to human health and the environment; OR, if I am a small quantity generator, I have made a good faith effort to minimize my waste generation and select the best waste management method that is available to me and that I can afford.

K. Handling Codes for Wastes Listed Above In Item # 14
1 = Gallons 2 = Cubic Yards

15. Special Handling Instructions and Additional Information
Truck # 9255

16. GENERATOR'S CERTIFICATION: I hereby declare that the contents of this consignment are fully and accurately described above by proper shipping name and are classified, packed, marked, and labeled, and are in all respects in proper condition for transport by highway according to applicable international and national government regulations.
If I am a large quantity generator, I certify that I have a program in place to reduce the volume and toxicity of waste generated to the degree I have determined to be economically practicable and that I have selected the practicable method of treatment, storage, or disposal currently available to me which minimizes the present and future threat to human health and the environment; OR, if I am a small quantity generator, I have made a good faith effort to minimize my waste generation and select the best waste management method that is available to me and that I can afford.

KEYSTONE INSPECTION REPORTS

PRECONSTRUCTION MEETINGS

KOPPERS COMPANY, INC.
SUPERIOR, WI

SURFACE IMPOUNDMENT CLOSURE
EPA I.D. NO. WID006179463
PROJECT 178275-04

MEETING NO. 1

DATE: Wednesday, September 7, 1988

LOCATION: J. R. Jensen's office - Superior, Wisconsin

PRESENT: Keith Jensen - President, Jensen & Son
David Shaw - Plant Manager, Koppers Company, Inc.
Walt Kuenzi - Project Manager, Keystone Environmental Resources, Inc.

The following items were discussed.

1.1 **Koppers Team** - David Shaw, Koppers Plant Manager, will serve as Construction Coordinator and Resident Inspector. Assisting him locally will be Fred TePaske from STS (soil testing, etc.) and John Hinzmann from Seaway Engineering (surveying). Also serving to assist in overall project conformance, technical approvals, and certifications will be Richard Van Tassel and Walt Kuenzi from Keystone Environmental Resources, Inc.

1.2 **Contractor's Team** - Keith Jensen outlined his firm's plans for manning the project. Dale Piper will serve as site foreman, with equipment operators Bruce Buchanan and Clyde Fuller, laborers Joe Kutzler and Van Korhonen serving as the field nucleus. Truck drivers and hauling will be sublet to a local trucking firm. Keith and Jeff Jensen will serve as backup. Floyd Johnson will also assist as required.

1.3 **Scope of Work** - The plans and specifications were thoroughly reviewed to clear up any questions. The division of work (contractor's work, owner's work, work by others) was reiterated and the sequencing of all activities was established.

1.4 **Borrow Pits** - Keith Jensen, from J. R. Jensen & Son, Inc. (contractor), explained that obtaining clay from Koppers plant site would present problems that favor alternate sources. As a result, it was agreed to abandon plans to secure Koppers supplied clay. Potential sources of drainage materials and topsoil were also discussed. Samples of these materials were already on hand for inspection.

1.5 **Schedule** - A bar graph schedule was developed for all major categories of work after details pertaining to each element were reviewed, time estimates established, etc. Copy of the schedule is attached.

1.6 **Reporting** - It was agreed that David Shaw would prepare the **Daily Field Letter** and fax it to Monroeville each day. The purpose of this letter is to document all field activities, keep others informed, and to serve as part of the final construction report. A blank copy of this form is attached.

1.6.1 **Progress Meetings** - Weekly construction meetings will be called by David Shaw to review schedule, cost, and resolve any problems. Representatives from Jensen, STS, and possibly Seaway are to attend. Keystone representation will also occur at certain milestones. The Construction Coordinator will prepare and distribute a written report of each meeting.

1.7 **HDPE Liner** - Contractor advised that the liner work would be subcontracted to GeoSynthetics, Inc. (GSI), an experienced liner installer. The material would be procured from National Seal Company. Mr. Robert Brost of GSI was contacted (414/542-5523) to reconfirm that the work has been authorized, that shop production of the material should be released, etc. Mr. Brost was also reminded to submit various information to Koppers for transmittal to Wisconsin's DNR. (Koppers will follow up with a letter direct to GSI highlighting what is required).

1.8 **Geotextiles** - Contractor offered to supply a fabric manufactured by TREVIRA, style no. 1135. Several alternate geotextiles may also be submitted for consideration.

1.9 **Health & Safety** - It was acknowledged that all members of contractor's field personnel would receive the basic 24-hour Hazardous Workers Operations Training, and that all requirements of the project Health and Safety Plan that formed part of the bid document would be followed.

SURFACE IMPOUNDMENT CLOSURE
EPA I.D. NO. WID006179463
PROJECT 178275-04

MEETING NO. 2

DATE: Thursday, September 8, 1988

LOCATION: STS's office and lab, Superior, WI.

PRESENT: Fred TePaske, STS Consultants
R. Van Tassel and Walt Kuenzi - Keystone Environmental Resources, Inc.

2.1 Keystone Environmental Resources, Inc. has retained STS Consultants (geotechnical group) to provide sampling, laboratory analysis, field testing, and observation of construction during various phases of the work to assure conformance with plans and specifications.

2.2 Mr. Fred TePaske was given a thorough overview of the project (scope of work, key participants, etc.). The sequence of field activities and the construction schedule were covered to clearly show STS what would be expected as to the extent of their participation (testing and inspection frequencies, etc.). Mr. TePaske advised that STS services would be provided in a timely fashion to serve the project needs.

2.3 "Reporting requirements" were covered with STS, and they are to report to David Shaw each time they visit the site. In addition to providing information for the Daily Field Letter, STS is to provide both Shaw and Kuenzi, from Keystone, with prompt copies of all test results, reports, and recommendations.

2.4 The availability of unclassified fill, clay, drainage, and topsoil were discussed. The need for early sampling and analysis was readily acknowledged. Mr. TePaske's experience in the Superior area will be beneficial in identifying suitable borrow sources.

2.5 The afternoon was spent in visiting the job site and later to visit a potential borrow pit area to obtain unclassified fill and clay samples. A possible source of drainage material was also visited but the preliminary consensus was not favorable (material too fine with too much silt). Contractor was subsequently advised to submit or identify alternate sources for the drainage material.

2.6 The meeting with STS was concluded with a reiteration of scheduled site activities that will require STS's presence starting with proof-rolling - scheduled for Wednesday, September 14, 1988.

KOPPERS COMPANY, INC.
SUPERIOR, WI

SURFACE IMPOUNDMENT CLOSURE
EP I.D. NO. WID006179463
PROJECT 178275-04

MEETING NO. 3

DATE: Friday, September 9, 1988

LOCATION: Seaway Engineering Company, Duluth, MN

PRESENT: John Hinzmann, Jr. - Seaway
R. Van Tassel, Walt Kuenzi - Keystone Environmental Resources, Inc.

3.1 Keystone representatives met with Seaway to review the project and cover the survey services that will be required to satisfy the needs of the work plan. Reference drawings and specifications will be mailed to Seaway shortly.

3.2 Basic surveying services will establish points to be used to set up grids and cross-section locations. In addition to the initial survey to establish elevations after proof-rolling, Seaway will visit the site periodically as required to confirm proper grade elevations at the completion of placing each class of material. Seaway will also perform quantity computations to determine actual volume on of material in-place for review and approval of Keystone.

3.3 Organizational relationships between Koppers, Keystone, Jensen, and STS were covered. It was agreed that Seaway's day-to-day contact should be directly with David Shaw, while copies of all field notes, surveys, and quantity determinations should be given both to David Shaw and to W. Kuenzi from Keystone.

3.4 John Hinzmann, Jr. was advised to block out time on Seaway's weekly work schedule to serve the needs of the Koppers project. Their first visit to the site is scheduled tentatively for September 14, 1988, to survey the impoundment immediately after proof-rolling. Seaway requested that they be given two/three days notice in advance for future site visits.

STS Project 94580

Re: Field and Laboratory Test Results for the Koppers Company, Inc.
Surface Impoundment Closure in Superior, Wisconsin

Dear Mr. Stephenson:

Transmitted herewith, please find the results of our field and laboratory testing services performed for the above-referenced project. Our scope of work for this project was outlined in STS Proposal P-2092 dated August 25, 1988. Authorization to proceed was received with Keystone Environmental Resources, Inc. Purchase Order No. 10-8-30704 dated November 22, 1988. A brief overview of the field and laboratory testing services performed is given below.

The geotechnical engineering services provided for the closure project can be divided into two general categories:

1. Laboratory testing to evaluate the engineering characteristics of proposed borrow materials prior to construction.
2. Field and laboratory testing to check the quality of the "as-built" closure construction.

The enclosed test results are organized according to these two general categories. The test results are also divided into six groups representing the five soil layer components of the closure earthwork plus a group of geotextile laboratory test results for the HDPE liner. The laboratory test samples representing the five soil components of the closure are identified as follows:

Layer Description	Identification
Unclassified Soil Fill	A1
Clay Barrier	A2
Drainage Layer	A3
Cover Soil	A4
Topsoil	A5

The borrow source evaluation for each layer typically consisted of testing two samples designated B1 and B2. The laboratory testing performed for the borrow source evaluations consisted of Standard Proctor moisture density relationships and grain size analyses for all soil types plus Atterberg limits tests for cohesive soils. Permeability testing of laboratory compacted specimens of the clay barrier (A2) and drainage layer (A3) borrow samples was conducted in order to determine if the remolded permeabilities fulfilled the project requirements. The topsoil material was also tested to determine pH and fertilization requirements.

The field and laboratory testing of the "as-built" construction included field density testing of each compacted lift and laboratory testing of individual soil samples representing each lift. The laboratory soil testing typically consisted of grain size, Atterberg limit and permeability testing as required to confirm the soil properties identified during the laboratory testing of borrow source samples. The identification of laboratory soil samples representing "as-built" construction includes identification of the component layer and lift number, i.e., sample A1-C5 represents the fifth lift of unclassified soil fill. Field density test and laboratory sample locations are shown schematically on individual test location plans.

Geotextile laboratory testing of the HDPE liner included determination of melt index, environmental stress crack resistance, thickness, density, modulus of elasticity and tensile strength with percent elongation properties. This series of tests was performed on specimens which represented both of the two batches of liner product delivered to the job site. The integrity of the liner seams was also evaluated by field leak testing which was observed by our senior technician and laboratory testing of four seam samples. The laboratory testing of the liner seam samples included determination of bonded seam strength and peel adhesion. The seam sample locations are shown on a diagram which precedes the laboratory test results.

Based on the results of our field and laboratory testing program, it is our opinion that the closure has been constructed in general conformance with the project requirements and specifications. All field and laboratory testing performed for this project was performed in general conformance with applicable ASTM Specifications.

If there are any questions regarding the contents of this letter or the attached test results, or if we can be of further assistance in any way, please feel free to contact us.

Respectfully,

STS CONSULTANTS, LTD.

Melvin B. Smith, P.E.

LIME NEEDS AS 100% ECCE (lbs/acre) to pH 6.0	No lime required.			No lime required.		
to pH 6.5	4300 lbs of lime for 6 inch plow depth.			2700 lbs of lime for 6 inch plow depth.		

ADDITIONAL RECOMMENDATIONS AND COMMENTS:

(1) Reduce N REC 20 lbs/A with non-forage legumes or 35 lbs/A with forage legumes as previous crop (except for corn rece).
(2) For PASTURE under intensive management apply an additional 50-100 lbs/A of N, 20 lbs/A of P205, 40 lbs/A of K20 on mineral soils.
(3) Reduce LIME REC by one half for western Minnesota, the Dakotas, and in areas having limy subsoils.
) The standard recommendation is taken from University of Minnesota unless otherwise indicated.
) Refer to reverse side for explanation of soil tests and fertilizer recommendations.

Superior, Wisconsin 54880

Dear Fred,

Re: STS Inh # 91580 AGP Lab number 60-10-88.

The following are the results of the testing of the two different batches of material that were identified as Batch #3771 and Batch #3770. You requested that a melt index be performed as well as Environmental Stress Crack Resistance (ESCR).

MELT INDEX - ASTM D1238 190 2.1A

BATCH # 3771	0.49 GMS. 10 MIN.
BATCH # 3770	0.49 GMS. 10 MIN.

ESCR - ASTM D1693 CONDITION C, 100° C, AND 100 % IGEPAL.

BATCH # 3771	500 HOURS NO FAILURES
BATCH # 3770	500 HOURS NO FAILURES

The procedures that were followed and the total hours of conditioning were in accordance to the specified test procedures of ASTM. The total test hours for ASTM D1693 were derived from the National Sanitation Foundation (NSF) Standard 54.

The test results and testing were done in accordance to specified procedures with no consideration to actual application. The results are presented in good faith, with the values presented only representing the samples that were submitted to AGP. These values should not be construed or the values implied to any other material except for the samples tested.

Respectfully yours,

Wayne Youngblood

ASTM D-3083

STS Job No.: 94580
Project: Surface Impoundment Closure for Kopper's Co.
Geotextile: HDPE Seam #19
Specimen: 1" wide-20"/min
10/20/88

SUMMARY OF TEST RESULTS

Specimen No.	Strength at Yield (lbs)
1	124
2	117
Ave.	120

Both samples stretched, then broke at edge of seam

STS Consultants Ltd.

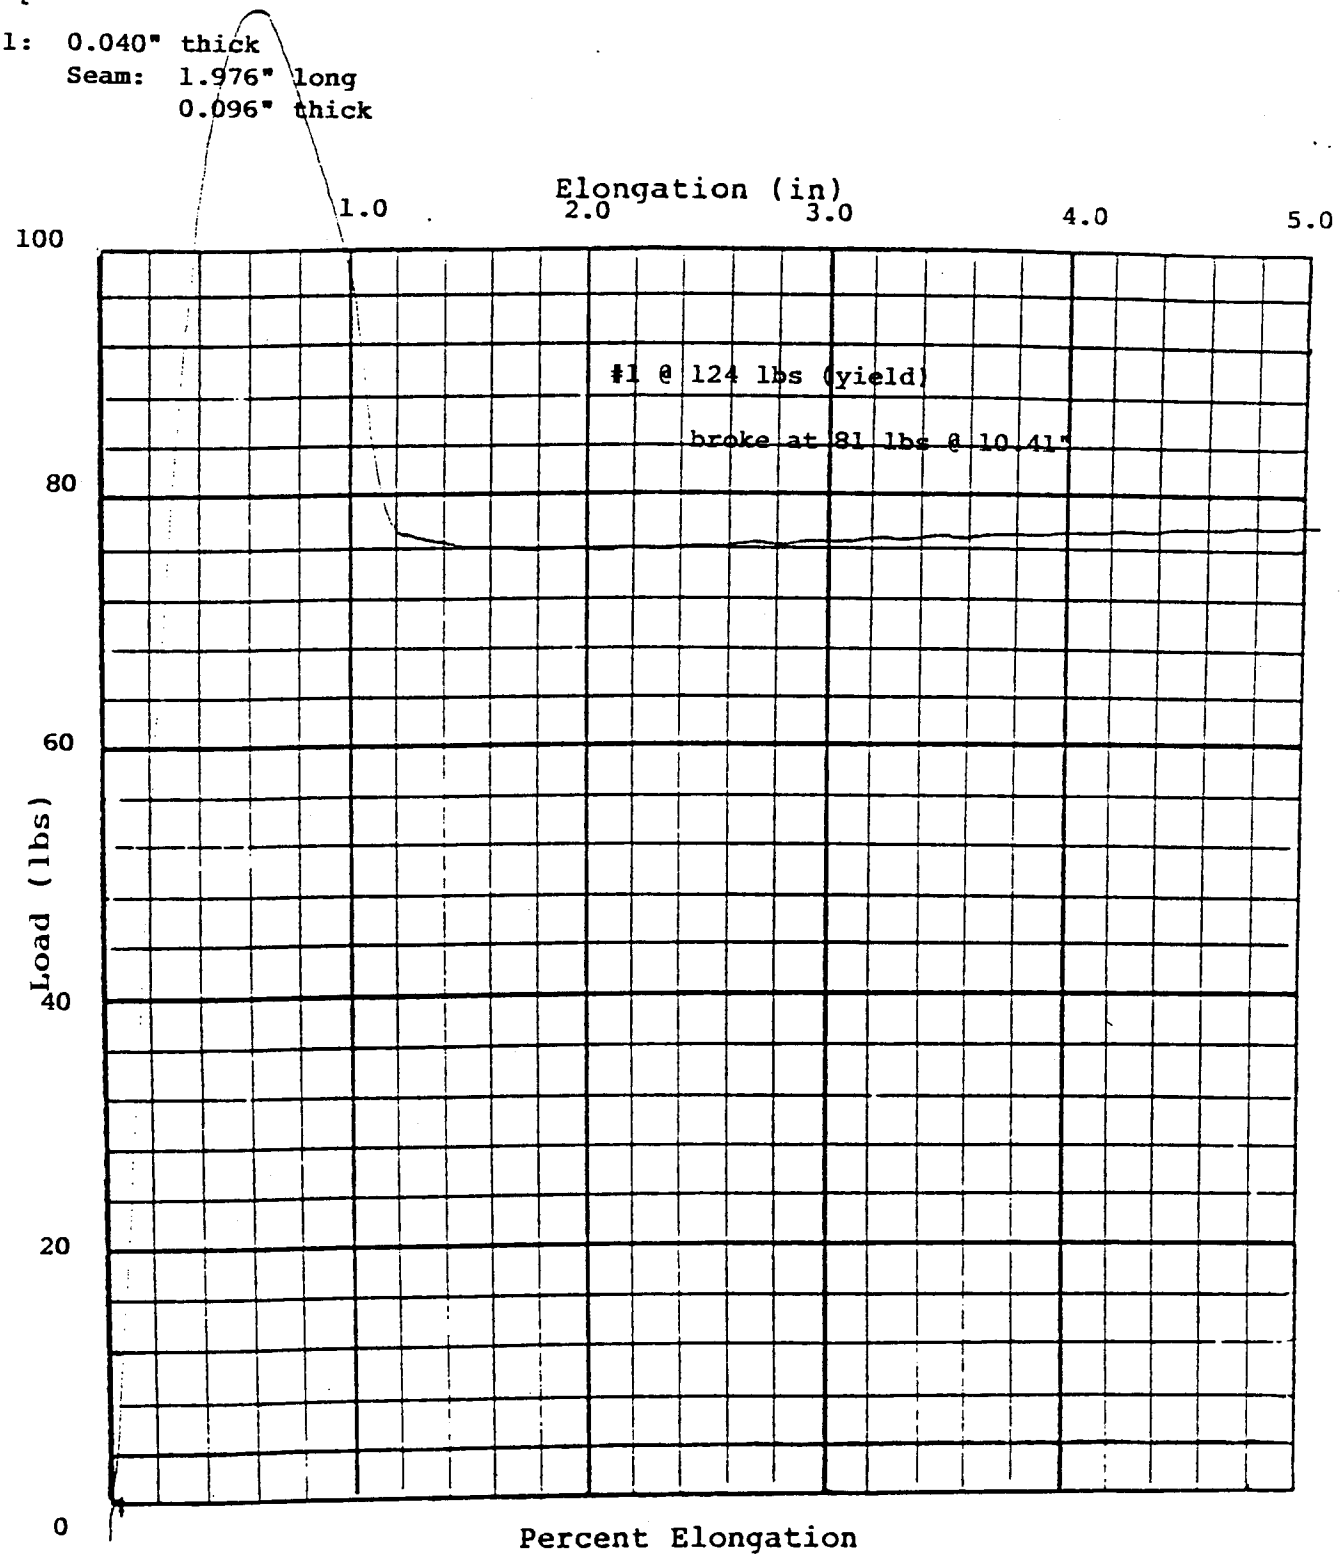
20"/min

Bonded Seam Strength
ASTM D-3083

STS Job No.: 94580
Project: Surface Impoundment Closure
Geosynthetic: Seam #19
Specimen 1" wide

Tensile Strength (lbs 120 lbs
% Elongation at Break:
Modulus at _____% Elongation:
Ave. of 2 tests

#1: 0.040" thick
Seam: 1.976" long
0.096" thick



Sample stretched, then broke at edge of seam

STS Consultants Ltd.

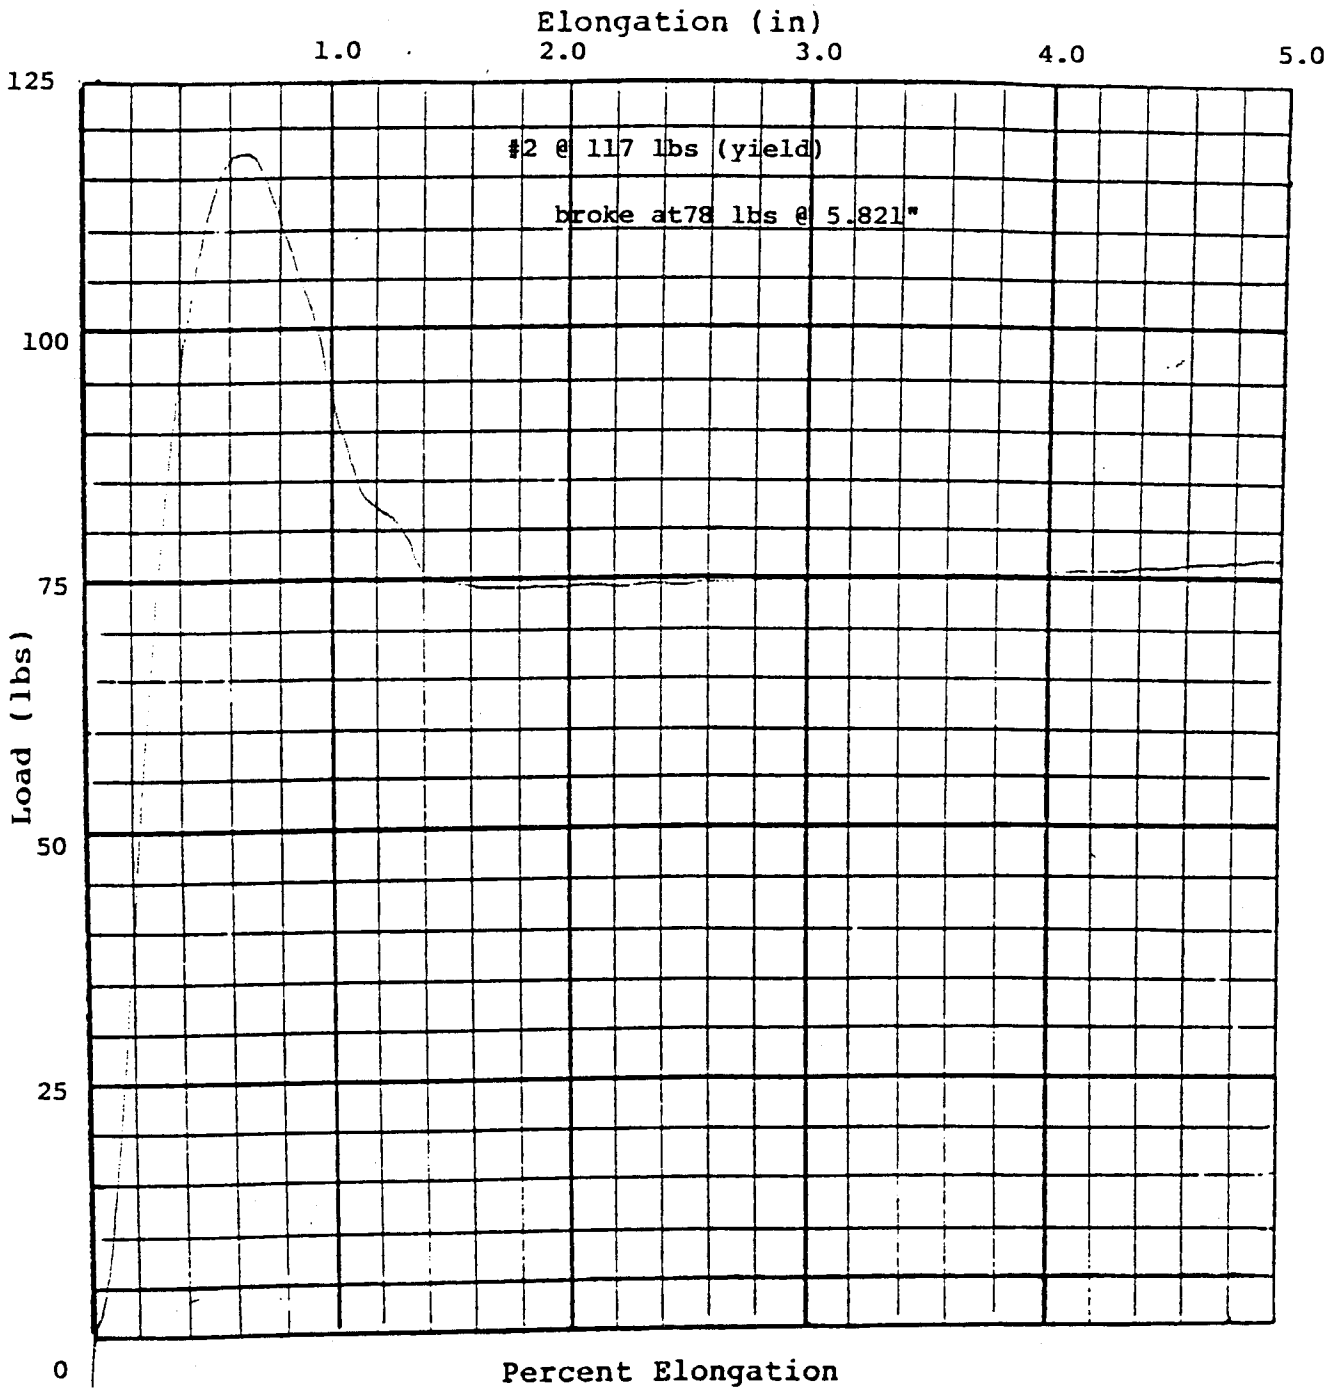
20"/min

Bonded Seam Strength
ASTM D-3083

STS Job No.: 94580
Project: Surface Impoundment Closure
Geosynthetic:SEam #19
Specimen 1" wide

Tensile Strength (lbs 120 lbs
% Elongation at Break:
Modulus at _____% Elongation:
Ave. of 2 tests

#2: 0.040" thick
Seam: 1.976" long
0.086" thick



Sample stretched, then broke at edge of bonded area.

STS Consultants Ltd.

Peel Adhesion

ASTM D-413

STS Job No.: 94580
Project: Surface Impoundment Closure for Kopper's Co.
Geotextile: HDPE Seam #19
Specimen: 1" wide-2"/min, 180° peel
10/20/88

SUMMARY OF TEST RESULTS

Specimen No.	Peel Adhesion (lbs)
1	88
2	79
Ave,	84

Both samples broke at edge of bonded area, did not peel

STS Consultants Ltd.

2"/min
180° peel

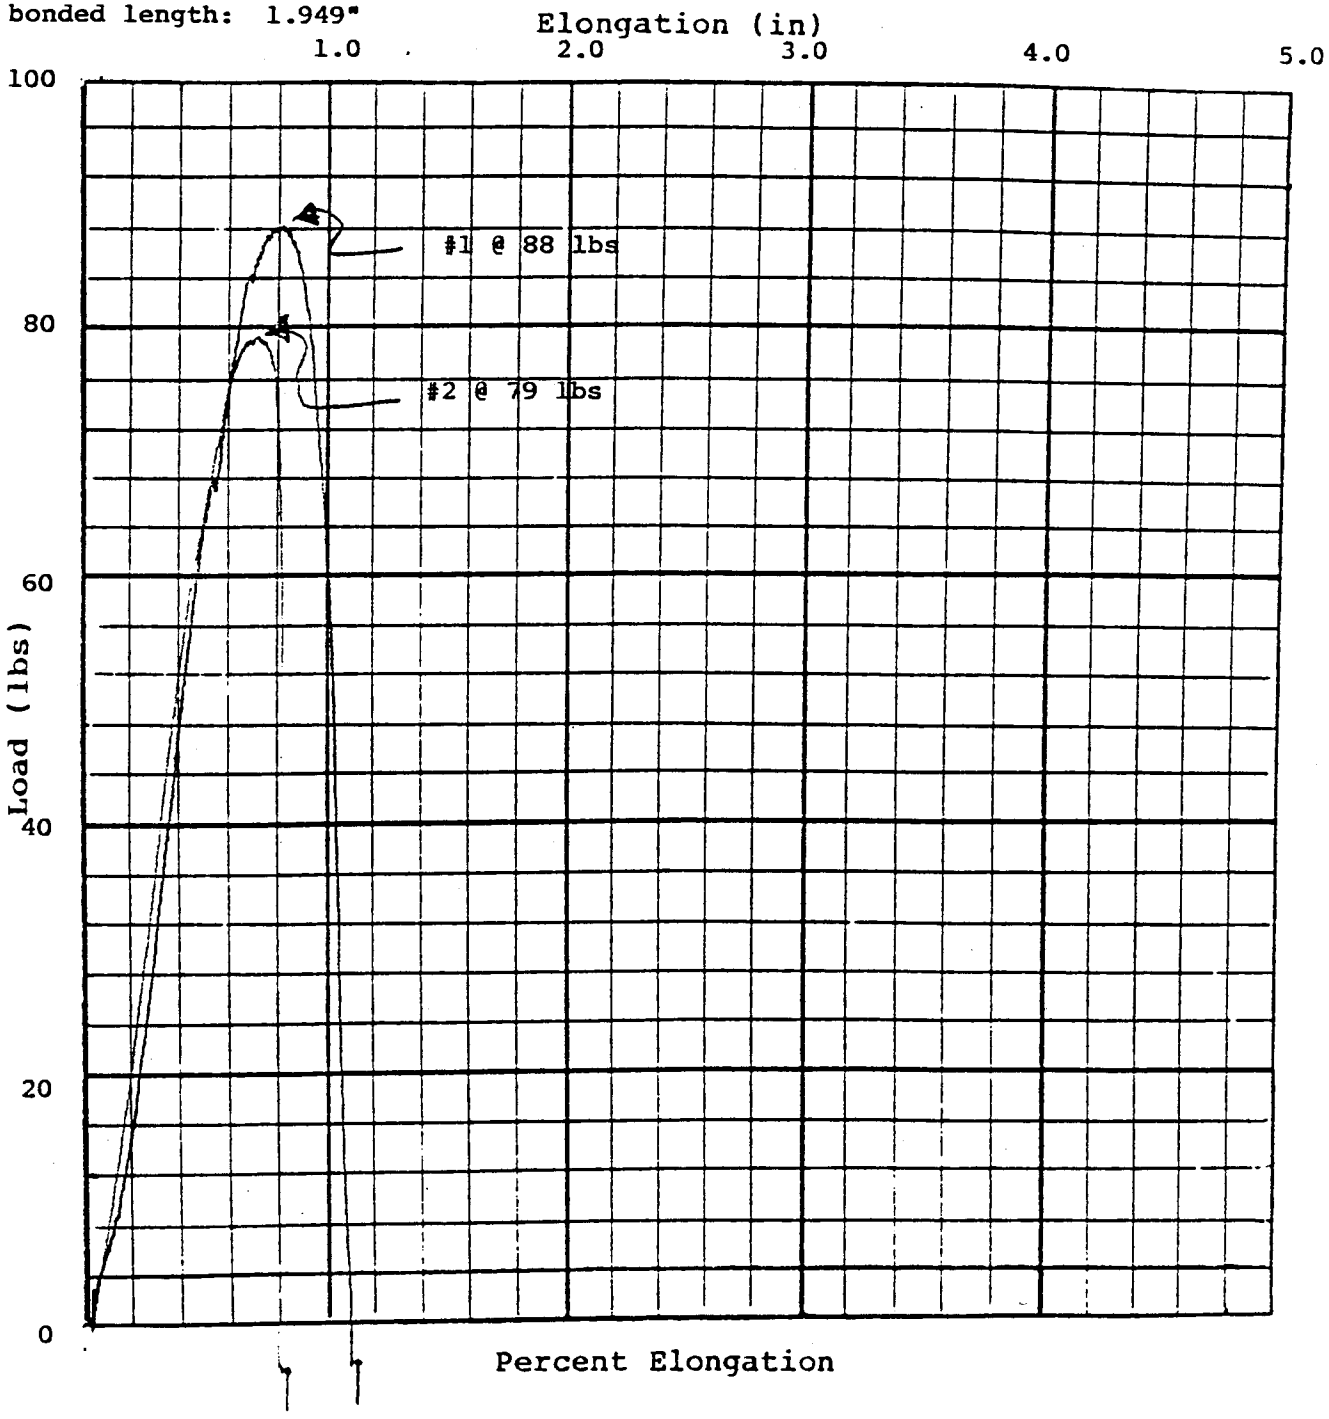
Peel Adhesion
ASTM D-413

STS Job No.: 94580
Project: Surface Impoundment Closure
Geosynthetic: Seam #19
Specimen 1" wide

Tensile Strength (lbs 84 lbs
% Elongation at Break:
Modulus at _____% Elongation:
Ave. of 2 tests

#1: 0.041" thick
bonded length: 1.976"

#2: 0.041"thick
bonded length: 1.949"



both samples broke at edge of bonded area, did not peel

APPENDIX F

MATERIALS AND SUPPLIERS LIST

SUPERIOR WISCONSIN PROJECT

MATERIAL LIST

CAP COMPONENT(1)	SOURCE / DESCRIPTION
Unclassified Soil Fill	Ray Konen on Highway "C", Douglas County, Wisconsin/Clay, trace sand.
Clay Barrier	Ray Konen on Highway "C", Douglas County, Wisconsin/Clay, trace sand.
HDPE Liner	Manufactured by National Seal Company, Installed by Geosynthetics Inc., a subcontractor/40 mil High Density Polyethylene.
Geotextile	Exxon Chemical Company/Filter Fabric stock number P1023, polypropylene, weight 10 oz./SY.
Drainage Layer	Allen Pit on Highway "B", Douglas County, Wisconsin/Fine to Coarse Brown Sand, trace gravel.
Cover Soil	Ray Konen on Highway "C", Douglas County, Wisconsin/Clay, trace sand.
Topsoil	J.R. Jensen Farm, Douglas County, Wisconsin/Elastic Silt, trace sand.
Seeding Cap Areas	Work completed by Kerrick Sod Co., Duluth, Minnesota, a subcontractor/ Prepared area, lime, fertilize, seed, and mulch.

Seed	C&K Seed Company, South St. Paul / 80 pounds/Acre Rye, Perennial 75 pounds/Acre Tall Fescue 30 pounds/Acre Birdsfoot Trefoil.
Fertilizer	Sturgeon Lake Fertilizer / 30 pounds of 5-10-5/1000 Square Feet.
Lime	Cutler (CLM) / 4 Tons Total
Mulch	Hay / 2 Tons/Acre

NOTES

(1) - Samples of the liner and geotextile are provided on the following pages along with the manufacturer specification sheets.

APPENDIX G

SYNTHETIC MEMBRANE CERTIFICATION REPORT

This report has not been received from G.S.I. It will be forwarded upon receipt by Keystone Environmental Resources, Inc.
