Dane County Landfill Site No. 2 Litter Control Plan

LITTER CONTROL PLAN DANE COUNTY LANDFILL SITE NO. 2

This Litter Control Plan outlines methods that will be used to control litter at Dane County Landfill Site No. 2, located at 7102 US Highway 12/18, Madison, Wisconsin.

Litter Control Measures

An important aspect of daily landfill maintenance is litter control. Blowing litter and debris will be minimized by:

- Maintaining a small working face.
- Applying daily cover or an approved alternate daily cover.
- Spreading and compacting waste immediately after unloading.
- Taking advantage of prevailing wind directions and orienting daily landfill operations accordingly.
- Collecting wind-blown litter on an as-needed basis.
- Placing temporary fences or wind screens around the working area to intercept blowing debris.
- Permanent fences around the landfill perimeter and property boundary to intercept blowing debris.
- Placing soil on areas of final grade as an intermediate cap, as soon as practical.

Site management may elect to close the site during windy conditions to limit windblown debris, or to only accept certain types of waste.

Monitoring and Cleanup

Litter will be monitored by landfill personnel on a daily basis during operations and will be cleaned up and disposed of on an as-needed basis. Litter will also be removed from surface water control structures as necessary.

As part of the Annual Report, Dane County Waste and Renewables documents and reports the following data; when wind speeds are greater than 30 mph, dates when the landfill was shut down due to high wind, and dates when staff collected off-site windblown debris.

Additionally, litter or windblown debris will be addressed as outlined in the “Negotiated Agreement Relating to the Third Rodefild Landfill Expansion” (Article II, Section C and Article III, Section H).
